THE INSTITUTE OF PAPER CHEMISTRY

Appleton, Wisconsin

CONTINUOUS EVALUATION OF CORRUGATING MEDIUM

INTRODUCTION

As requested by the Technical Division of the Fourdrinier Kraft Board Institute, Inc., the reports pertinent to the continuous evaluation of corrugating medium have been prepared by The Institute of Paper Chemistry on a bimonthly instead of monthly basis since August 1, 1961. The current report presents results obtained during the months of December, 1965 and January, 1966, on 169 rolls of corrugating medium representing the production of twenty-eight machines. Each of these 169 rolls of corrugating medium was evaluated for basis weight, caliper, Concora flat crush (conditioned after fluting), H. and D. flat crush on single-faced board, and runnability. The evaluation of runnability was initiated by corrugating each roll under standardized conditions on the Institute's corrugator into A-flute board at 600 feet per minute with minimum tension and recording the draw factor at this condition if the roll ran satisfactorily. If unsatisfactory runnability occurred at this speed, the corrugator was slowed down in increments of 25 f.p.m. until satisfactory runnability was obtained, i.e., no ruptured flutes. In this latter case the draw factor was recorded for the highest speed below 600 f.p.m. at which the roll ran satisfactorily. If the medium fabricated satisfactorily at 600 f.p.m. with minimum tension, further runs were made at higher tensions to determine when cracking occurred. The higher tensions used were 0.5, 1.0 and 1.5 lb. per inch. Flat crush was determined on the single-faced board obtained at a speed of 600 f.p.m. with minimum tension. The flat crush results, in addition to supplying information about quality, provide data which may be used by each participant to evaluate the relationship between Concora flat crush and combined board flat crush.

For each participating machine, test data for the current period are shown in Table I and presented graphically in Fig. 1 to 4. A tabulation of the number of rolls and type of medium evaluated is also given in Table I for each machine. The current machine test averages given in Table I are the means for each test property of the averages obtained on all rolls of corrugating medium evaluated from a given machine during the current period. In addition to the current machine test averages, Table I also presents the current F.K.I. averages, cumulative F.K.I. averages, and the F.K.I. indexes. The current F.K.I. average for each test property is the mean of the current machine averages for all machines participating in the study during a given period (excluding the current machine averages based on the evaluation of fewer than three rolls of corrugating medium as requested by the Technical Division). The cumulative F.K.I. average for each test property is the mean of the current F.K.I. averages for the previous twelve-month period excluding the average for the current period. The F.K.I. index for each test property is obtained as follows:

$$\frac{\text{current F.K.I. average}}{\text{cumulative F.K.I. average}} \times 100 = \text{F.K.I. index (\%)}$$

The F.K.I. index for each test property provides a ready means of comparing the current quality with previous results. An index greater than 100% indicates that current quality is higher than the average result for the previous twelve periods; an index below 100% indicates that current quality is lower than the average result for the previous twelve periods.

The test results obtained on the rolls submitted from the production of individual machines during the current period are shown in Tables II through XXIX for Machines A through Z and Machines AA and BB, respectively. The maximum, minimum and average results obtained on each roll are shown for all test properties

TABLE I  
SUMMARY OF CURRENT MACHINE AVERAGES  
December, 1965 and January, 1966

Mill Code	No. of Rolls	Type of Medium	Basis Weight, lb.	Caliper, points	Concora Flat Crush, p.s.i.	Single-Face Flat Crush, p.s.i.
A	8	Semichemical	27.0	10.2	37.9	34.0
B	8	Semichemical	27.5	10.7	32.8	29.6

<sup>a</sup>Maximum tension at 600 f.p.m.

<sup>b</sup>600 f.p.m., minimum tension.

<sup>c</sup>Maximum speed at which this roll could be corrugated with minimum tension was 450 f.p.m.

<sup>d</sup>Maximum speed at which this roll could be corrugated with minimum tension was 550 f.p.m.

<sup>e</sup>Maximum speed at which this roll could be corrugated with minimum tension was 500 f.p.m.

except basis weight for which only the average is shown; in addition, the overall average result for all rolls submitted for a given machine is shown for each test property. The latter overall averages are reported as "current machine averages." A cumulative machine average for each test property is also shown and represents the mean of the current machine averages for the previous twelve periods (excluding the current period). Also shown for each machine and for each test property in Tables II to XXIX are the machine factor and machine index which are defined as follows:

$$\frac{\text{current machine average}}{\text{cumulative machine average}} \times 100 = \text{machine factor (\%)}$$

$$\frac{\text{current machine average}}{\text{cumulative F.K.I. average}} \times 100 = \text{machine index (\%)}$$

The machine factor and machine index provide a means for comparing the current machine average for each test property with either the previous results for the particular machine or with the cumulative results for all machines, i.e., the cumulative F.K.I. average.

#### DISCUSSION OF RESULTS

Shown below from Table I are the maximum and minimum current machine averages noted for each test property during the current period (December, 1965 and January, 1966). Also shown below for each test property is the current F.K.I. average which represents the mean of the current machine averages for the current period and, hence, is indicative of the test level being maintained by the industry as a whole to the extent that the industry is represented by the participating machines. Also given below for each test property is the cumulative F.K.I. average which represents the mean of the current F.K.I. averages for the previous twelve months.

	Max. Machine Av.	Current Machine Av.	Current F.K.I. Average	Cumulative F.K.I. Average
Basis wt., lb.	28.5	25.8	26.9	27.0
Caliper, pt.	12.0	9.0	10.5	10.3
Concora flat crush, p.s.i.	40.0	30.7	34.8	35.3
Single-face flat crush, p.s.i.	36.8	27.5	31.5	32.1

The runnability data for the 169 rolls evaluated during the current period are summarized as follows:

Runnability	Number of Rolls	Percentage of Total Rolls	Cumulative Percentage
Less than 600 f.p.m. with minimum tension	14	8.3	100.0
600 f.p.m. - minimum tension	27	16.0	91.7
600 f.p.m. - 1/2 lb. per in. tension	40	23.7	75.7
600 f.p.m. - 1 lb. per in. tension	23	13.6	52.0
600 f.p.m. - 1-1/2 lb. per in. tension	65	38.5	38.5

Supplementary to the runnability data described above, draw factors were determined for each roll of medium at 600 f.p.m. with minimum tension (or, for rolls with poor runnability, at the maximum speed runnable with minimum tension) and are given in Tables II through XXIX for Machines A to Z and Machines AA and BB, respectively.

In Table XXX a comparison of Institute and mill Concora flat crush test results obtained on conditioned specimens is given for each machine for the current period. The inclusion of these comparisons is made possible by the fact that interested participants submit their Concora flat crush test results to The Institute of Paper Chemistry (on data sheets obtainable from the Institute). This affords each participant the opportunity to review the level of agreement noted for his data with the levels noted for the other participants. Comparisons of this kind are a helpful adjunct to other calibration procedures. Shown in Table XXX are (1) the Institute and mill Concora averages for each roll included in these comparisons, (2) the difference between the roll average based on Institute data and that based on mill data, (3) the Institute and mill averages based on all rolls included in the comparison, and (4) the difference between these overall averages.

The Concora flat crush data shown in Table XXX are summarized in Part I of Table XXXI where for each machine the following information is given: (1) Current machine average based on Institute data, (2) current machine average based on mill data, (3) the average differences - that is, the difference between the current machine average based on Institute data and that based on mill data, and (4) the maximum difference encountered in comparing Institute and mill test averages for individual rolls. In Part II of Table XXXI the average differences given in Part I have been converted to percent. Comparative data from the previous two reports are also included in Part II of Table XXXI.

PART II: A TABULATION FOR EACH MACHINE OF THE AVERAGE DIFFERENCE (PERCENT) BETWEEN THE CONCORA FLAT CRUSH  
BASED ON INSTITUTE DATA AND THAT BASED ON MILL DATA

Average difference, %<sup>d</sup>

Current report (Dec.-Jan.)	-2.6	+0.6	+1.5	+0.6	-3.9	+5.1	-3.4	+2.3	+2.3	+0.5	+1.0	+9.3	+33.9	-1.4	0.0	+4.2	--	-2.6	-4.2	-1.4	+1.4	+1.5	--	-0.3	-7.6	+1.9	+1.2	-1.9
116th report (Oct.-Rev.)	-2.3	+1.8	-2.0	+1.4	-6.3	-3.4	-4.2	+4.3	+4.7	-1.8	-0.3	-0.9	+5.1	--	0.0	-1.5	--	+3.5	+1.0	-1.1	-0.3	+7.8	--	--	-5.0	-7.3	+0.8	-5.1
115th report (Aug.-Sept.)	+1.7	+2.9	+0.5	+3.4	-1.4	-1.2	+3.4	-4.2	+8.2	-4.4	+0.3	-5.5	+3.1	--	-1.6	-4.9	--	-6.5	-8.0	-2.4	--	+12.9	--	--	-3.1	-1.7	-1.4	-4.4

<sup>a</sup>Comparisons based on current machine average include only those rolls for which mill data were submitted.

<sup>b</sup>Average difference is the difference between the current machine average based on Institute test results and that based on mill test results with the Institute test results used as the reference. See Table XXX.

<sup>c</sup>Maximum difference is the greatest difference encountered in comparing Institute and mill test averages for individual rolls. See Table XXX.

<sup>d</sup>Average difference (percent) is computed by dividing the average difference in p.s.i. (shown above in Part I of this table) by the Institute current machine average and multiplying the result by 100.

In Table XXXII a summary of the agreement between Institute and mill Concora flat crush data is given for the current period; comparative data from the previous bimonthly period are also included. The data shown for the current period indicate that agreement between Institute and mill Concora data was good and, at some levels of comparison, somewhat better than the agreement for the previous period.

TABLE XXXII

SUMMARY OF AGREEMENT BETWEEN INSTITUTE AND MILL  
CONCORA FLAT CRUSH DATA

Average Percentage Difference Between  
Institute and Mill Concora Flat Crush  
Test Results<sup>a</sup>

Percentage of All Machines Included  
Within the Indicated Range  
Previous Period<sup>b</sup> Current Period<sup>c</sup>

$\pm$ 1.0	23.1	23.1
$\pm$ 2.5	53.8	53.8
$\pm$ 5.0	73.1	84.6
$\pm$ 10.0	92.3	96.2
Max.	100.0 <sup>d</sup>	100.0 <sup>e</sup>

<sup>a</sup>The average obtained at the Institute was used as the reference in the calculation of the percentage differences.

<sup>b</sup>October and November, 1965.

<sup>c</sup>December, 1965 and January, 1966.

<sup>d</sup>Maximum percentage difference was 15.3.

<sup>e</sup>Maximum percentage difference was 33.9.
