A MODEL FOR THE ECONOMIC EVALUATION OF
SLIDING FEE SYSTEMS FOR PUBLIC
CHILD DAY CARE SERVICES

Approved:

Thomas B. Clark, Chairman

Cecilia Johnson

Jerry Banks

Date approved by Chairman 5/9/78

PREFACE

Three points concerning the objectives and scope of the research reported herein should be noted at the outset:

1. The research does not address the long range socio-economic implications of publicly-funded day care services or the use of sliding fee schedules. For example, the thesis does not attempt to support or refute the notion that such programs encourage low income families to become more self-sufficient. Existing governmental policies in these areas (and the values, assumptions, and theories which underlie them) are not questioned.
2. The model developed here is intended to serve as a mechanism for comparing the demand, service, and financial implications of alternative administrative strategies (e.g., fee schedules, eligibility cut-off points, service supply levels) and future environmental circumstances (e.g., demographics, service costs). In its present form, the model is not intended for use in forecasting precise quantities for the various output variables.
3. The model test runs reported in the thesis use significant amounts of estimated data. Much of the

required data was not readily available, and the collection of such data was beyond the scope of the thesis. In all cases, however, the data are inputs to the model and are not imbedded within the computer code. The modeling process defines the specific data requirements. Hopefully, the existence of the model as an operable computational mechanism will provide an incentive for the acquisition of the data necessary to implement the model as a management planning tool.

ACKNOWLEDGEMENTS

I want to express my most sincere gratitude to Dr. Thomas Clark, my Thesis Advisor, for all his assistance, guidance and recommendations during the development of this work.

I would also like to acknowledge Professor Cecil Johnson and Dr. Jerry Banks who served on the Reading Committee.

To Lee Cash, Jerry Legge and the cooperative staff of The Georgia Department of Human Resources, Title XX Administration, appreciation is extended for their assistance in developing the Thesis topic and supplying pertinent information.

CHAPTER I

INTRODUCTION

1.1 Background

The topic for the thesis was developed in cooperation with Mr. Lee Cash, Research Associate of the Georgia Department of Human Resources, Title XX Administration. The Department of Human Resources has been interested in developing a sliding fee system for day care centers to be implemented throughout the State of Georgia. A sliding fee system is the mechanism by which participating families share the cost of child care services with the government according to their ability to pay. The problem is that of allocating scarce resources efficiently throughout the State of Georgia to a designated population segment. These scarce resources are the limited Federal funds that are allocated for day care services and the limited number of facilities and staff personnel. The recipients are families within certain family income and family composition ranges. Little is known, however, about the short or long range impacts of various forms of sliding fee systems on resource usage, services provided, or costs incurred.

1.2 Statement of the Problem

Before 1976, a child in Georgia could obtain free day

care if the gross family income was less than 61 percent of Georgia's median family income adjusted for family size. For example, the median income for a family of four was \$1,142 per month yielding a 61 percent cut-off point of \$697 per month. If the family gross income exceeded the above cut-off amount by one or more dollars per month, the child had to be taken from the free public day care and placed in a private center, at a cost of \$100 or more per month.

The abrupt cut-off of free day care service produces a dysfunctional "notch effect". The notch effect creates a disincentive for families to increase their income. It has a paradoxical effect of loss in real net income incurred over a certain income range. As income rises, the family experiences a loss in benefits in cash or in kind for which they were previously eligible. A family might lose public housing, cash assistance payments, social security supplemental income, and medicaid subsidies worth over \$1,000 per year, if earned income increases from \$4,300 to \$4,400 (i.e., an increase of only \$100). Other potential losses include Aid to Families with Dependent Children, food stamps, and increased income tax. Hence, the notch effect is the resultant drop in the family's real net income associated with the rise in earned income. With or without a sliding fee scale for day care payments, the notch effect can take place due to these other economic losses. The sliding fee schedule, however, is designed to ameliorate the notch effect as far as the cost of day care

services is concerned.

The administrative mechanism for a sliding fee system is set forth in H.R. 1, Title XX, Part B, Section 2134 (a)(2) instructing the Secretary of Health, Education and Welfare to "prescribe such schedule or schedules as may be appropriate for determining the extent to which families are required (in the light of their ability) to pay the costs of child care for which provision is made under Section 2112 (a)(1)". The fee schedules can then be translated into relationships that will determine how the full cost of child care is to be shared between public funds and the participating families using child care services under the welfare reform legislation (H.R. 1).

The purposes of sliding fee scales are:

- (a) To allocate scarce resources equitably and efficiently among many recipients.
- (b) To encourage families to increase their earned income to the point of self-sufficiency, or at least to avoid creating disincentives for doing so.
- (c) To achieve equity in fee payments among those families that will be sharing the costs of day care.

Some examples of alternative forms of sliding fee scales are graphically portrayed in Figure 1-1.

In January of 1977, the State of Georgia implemented an "Interim Fee System". This system is a pilot program implemented on a temporary basis until a permanent sliding fee system is designed. Under the Interim System, the State provides free day care services to approximately 11 percent of

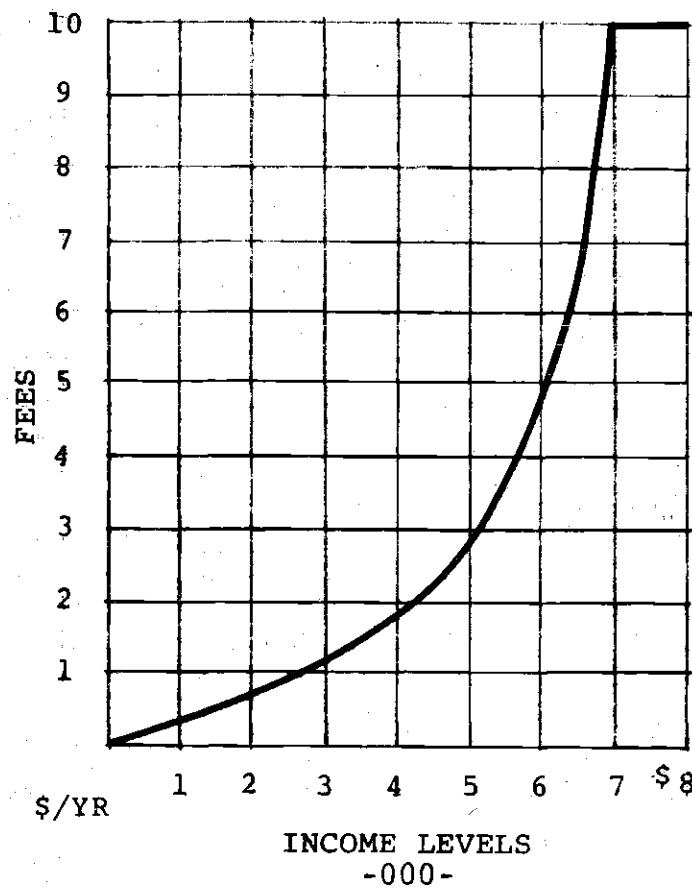

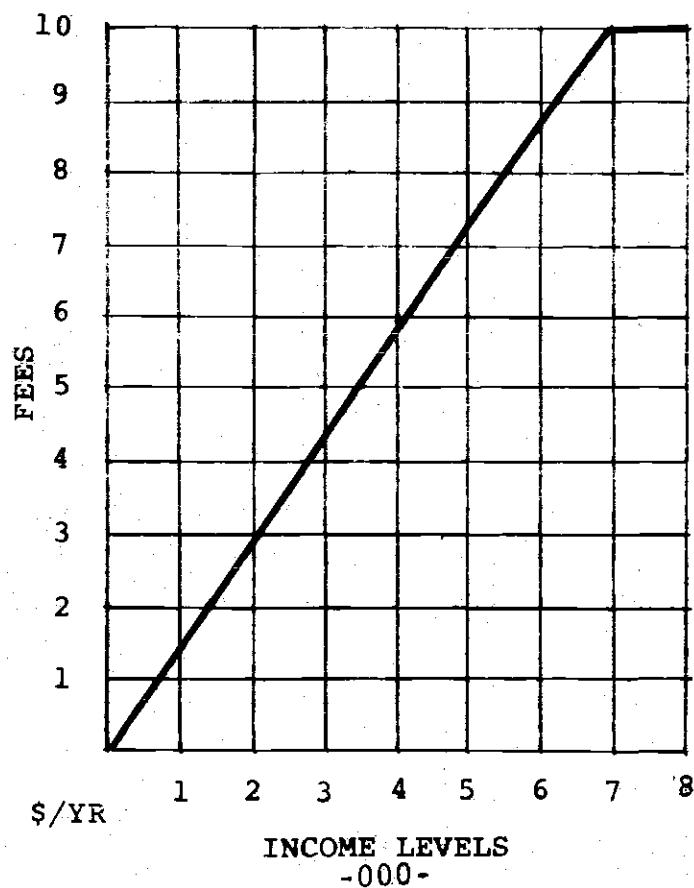

FIGURE 1-1. EXAMPLES OF SLIDING FEE SYSTEMS

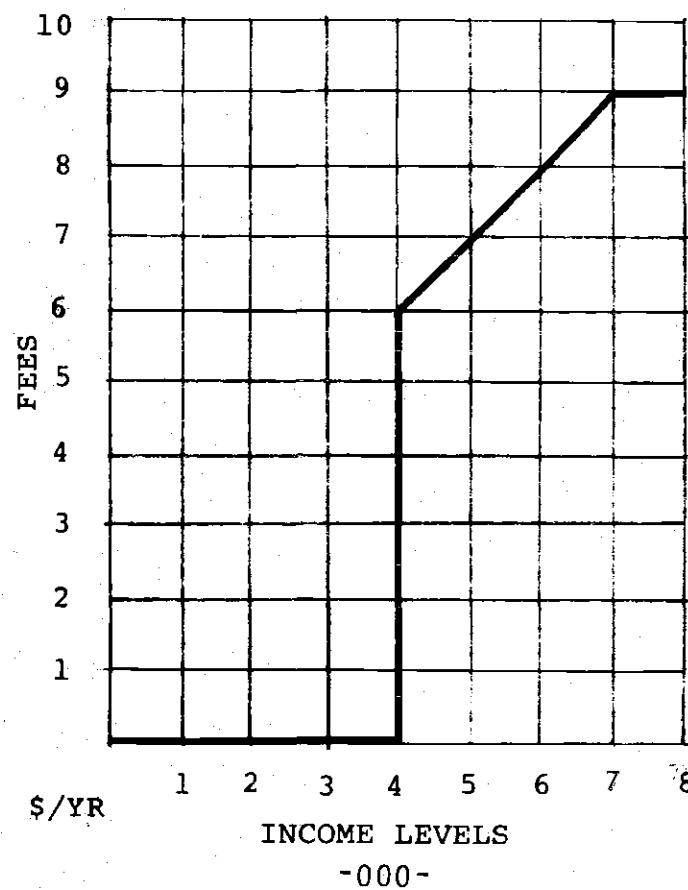

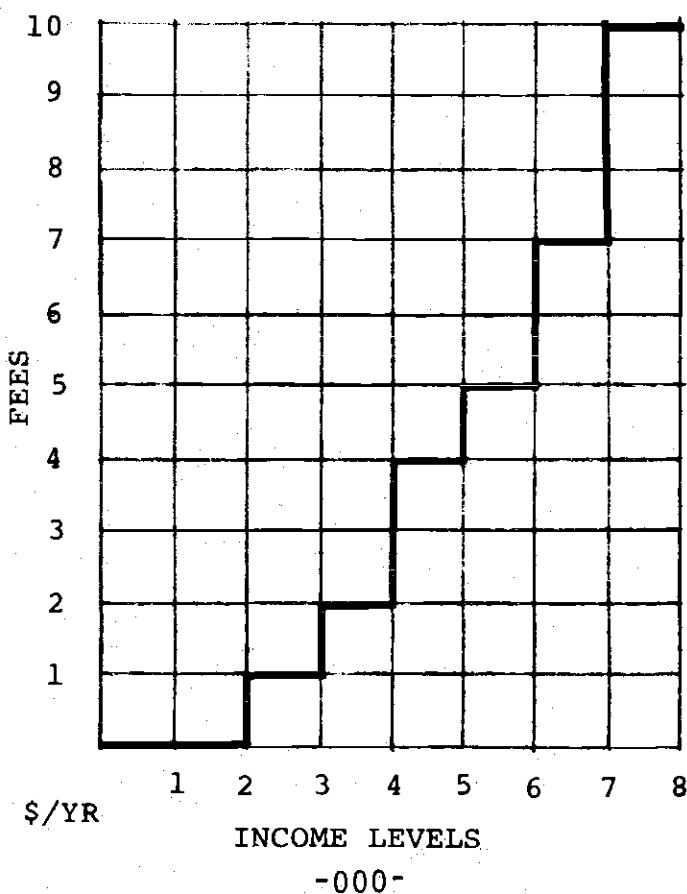

FIGURE 1-1A. EXAMPLES OF SLIDING FEE SYSTEMS

the 104,000 children whose family income is less than 61 percent of the State's median family income adjusted for family size in accordance with Federal regulations. The maximum gross income for a family of four to receive complete, free day care is \$607 per month or \$3,364 annually. The families earning between 61 and 80 percent (or \$698 and \$911 per month) are obliged to purchase the day care service in accordance with the Interim Fee System. Families eligible for the Interim Fee System are those that were participating in Title XX day care service as of October 1, 1976, or new families whose income falls below the 61 percent-of-median level. New families earning between 61 and 80 percent of median income (i.e., \$697 per month to \$911 per month) desiring to use the public day care centers are not eligible to enter the system. Any family earning over 80 percent of median income does not qualify to participate in the Interim Fee System program.

The child care fee scale is depicted in Table 1-1. An example of the interim fee schedule for a family of four is depicted in Figure 1-2.

The purpose of the present Interim Fee System is to provide a smooth transition from free to full cost day care service. This Interim Fee System took into account family size and income. The 11 percent (12,000 children) level of service was not reduced under the Interim System. The funds generated from this system are being used to reduce the Federal Financial Participation.

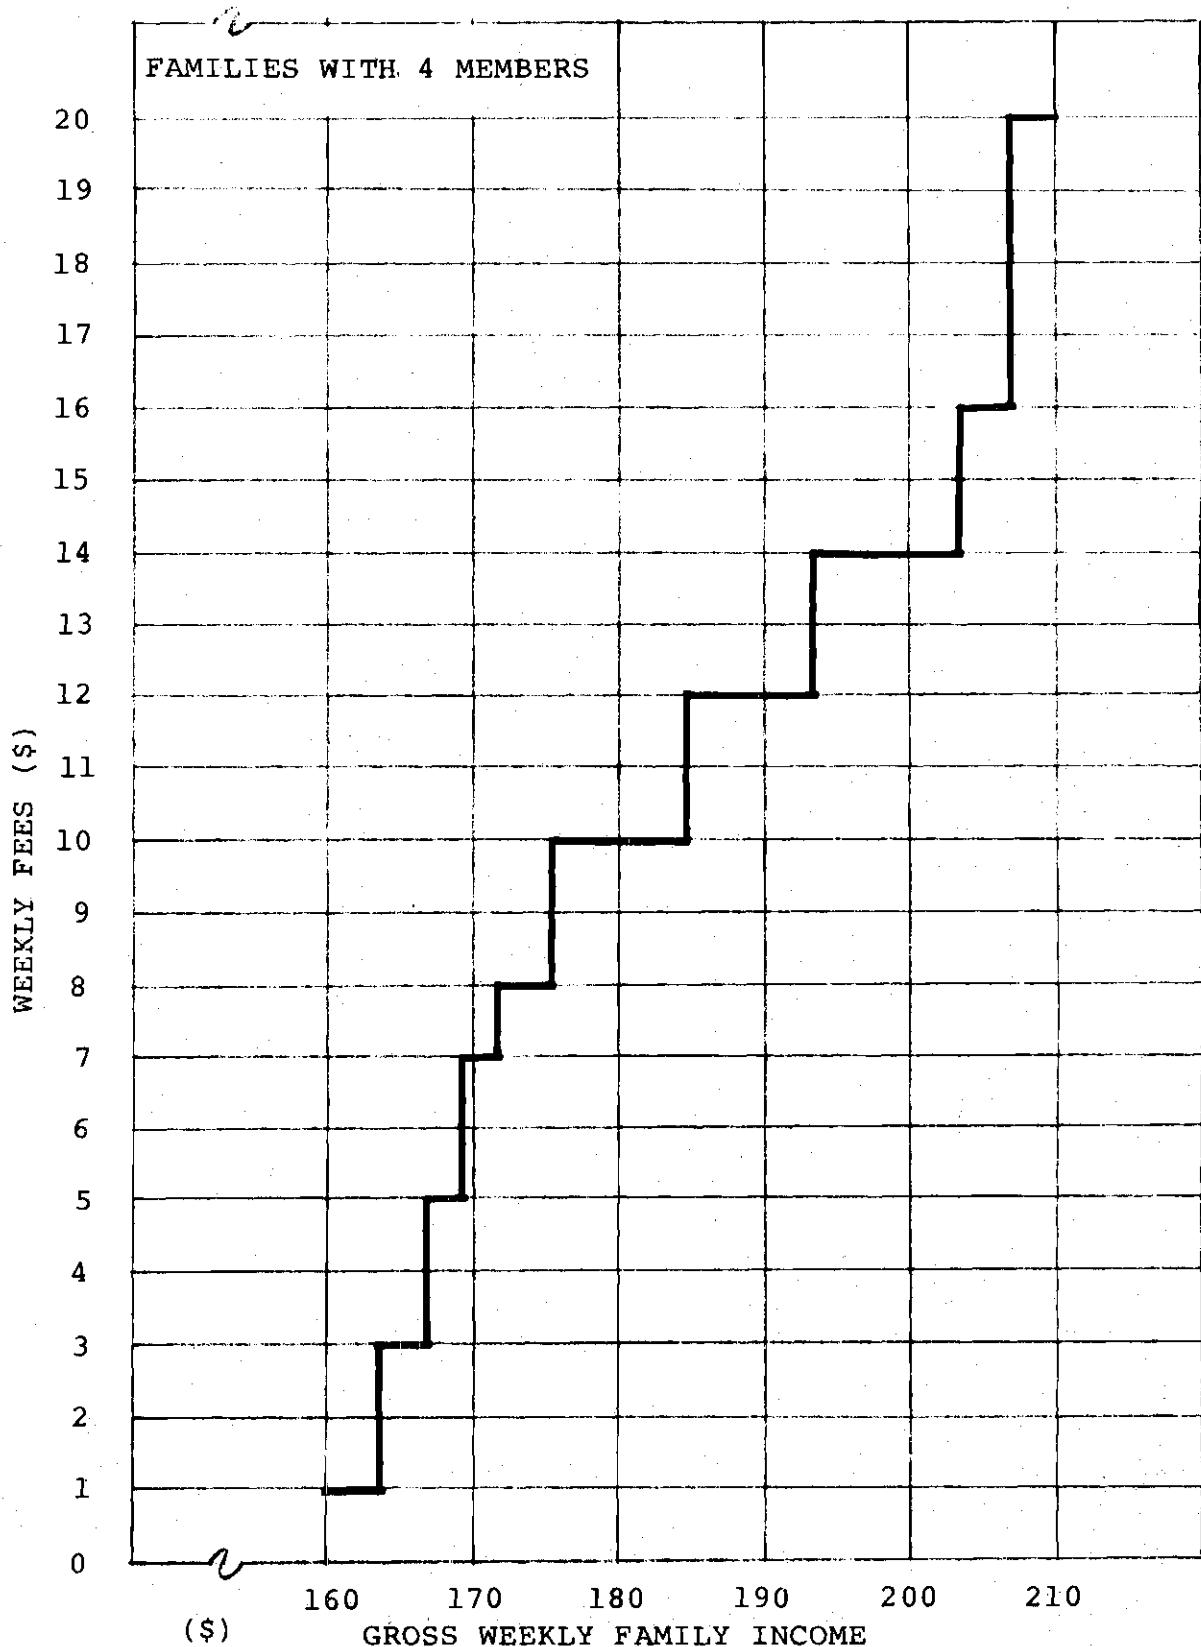

FIGURE 1-2. EXAMPLE OF INTERIM FEE SYSTEM

A major problem in the development of sliding fee scales is the lack of methodologies, models, and data required to evaluate the economic impacts of alternative fee scales on both the client population and the government. The problem is complex, even in the short run. To evaluate the long range impacts, it is necessary to recognize that the system exists in a dynamic environment. The number and characteristics of eligible children are constantly changing, as changes occur in family size and income distributions. The level of supply of government subsidized day care services is also likely to increase over time. The State's cost per child for providing the day care service can also be expected to inflate. The dynamic nature of the problem strongly suggests the applicability of a demographic economic simulation approach.

1.3 Objective, Scope and Limitations

The objective of the thesis is to develop a simulation model to assist the Georgia Department of Human Resources in the economic evaluation of alternative sliding fee scales for day care services. The simulation model is designed as a management tool in which DHR can easily adjust the initial conditions, fee scale parameters, and other economic and demographic assumptions. The model provides the computational mechanisms required to:

- (a) Analyze the economic impact on real income of the participating families.
- (b) Analyze the economic impact on the State of Georgia.

- (c) Analyze the impact on the demand and supply of child day care services.

The model is an abstraction of a real world problem which is very complex. The basis for the child care fee system is the Title XX section of the Social Security Act. Any changes in public law and policy could require changes in the basic structure of the model developed here. The State of Georgia has flexibility to implement their policies and concepts of child day care services. The administration of such a complex program can create regulations that could modify the model's ability to represent the real world situation. The lack of available data on child care creates the need for many assumptions and projections that could necessitate modifications as additional information becomes available. The model is designed, therefore, to facilitate user changes in the data base and model parameters.

The model provides the framework and mechanism for DHR to evaluate several sliding fee systems. DHR must provide data they wish to use. The primary source of data used in developing the model was the 1970 Census of the Population and other information received from the Georgia Department of Human Resources.

The problem addressed in this thesis is not unique to the State of Georgia. Virtually every state is faced with the problem of designing sliding fee scales in a complex environment. Though the model developed for Georgia may not

be directly applicable to any other state, the methodological concepts and the overall organization of the model should be of value to other states seeking to develop similar models.

1.4 Literature Survey

In the literature survey, emphasis was placed on studying the regulatory environment, the national and state day care system operation, and the need for a fee system to efficiently allocate resources.

The reports specifically address the problem of designing and evaluating sliding fee systems. Cash completed a thesis entitled "A Model for Sliding Fee Systems in Public Day Care" at Georgia State University in 1976. The objectives of the thesis were "...to develop a predictive model that can describe the potential impacts of sliding fee schedules" and "...to consider how a fee schedule should be selected and how the administrative machinery required to implement the proposed fee schedule should be used to evaluate the impact and effectiveness of that schedule" [3, pp. 22-23]. The model developed has several limitations:

- (1) The number of children in a family is not considered.
- (2) The costs of day care are held constant.
- (3) The model assumes that 11 percent of all 0-6 year olds at each income level will be served.

The output of Cash's model gives the number of children served, monthly fees, and monthly cost to the government over

several income ranges for varying fee rates on a one-time basis. This model provides one estimate at a single point in time. Cash concludes that there is a "...lack of a clear methodology for developing sliding fee systems for public day care" and there is "...a gap in the professional literature on the public administration of day care" [3, p. 42].

Abt Associates, Inc. of Cambridge, Massachusetts, published in 1972 a report entitled "Sliding Fee Schedules - A Simulation Analysis of Child Care Service and Cost under Welfare Reform" for the Department of Health, Education and Welfare. The objective of the project was "to identify a range of alternative fee schedules and to analyze the implications of each fee schedule in terms of the numbers and characteristics of families and children likely to be served, the cost of child care services to the government, and the cost to participating families" [2, p. I-1]. The report discusses in detail the payment mechanisms for subsidizing child care under H.R. 1. Abt compares linear and various types of nonlinear fee schedules as they impact upward-mobile families across the income breakeven point. They conclude that "...the overall impact of curving fee schedules cannot be predicted exactly since static and dynamic effects may be different" [2, P. II-24]. The Abt model (called SIMFARE-C) does not consider income notch effects produced by losing Medicaid, public housing, Aid to Families with Dependent Children, FICA, and Federal and State income tax. The model does not take into

account the IRS income tax deduction for child care. The model considers the manipulation of a single input data base at a one-time iteration, assuming all demographic factors remain constant throughout a one-year period. There is no consideration of the dynamic nature of the population environment over time. Abt also assumed a perfectly elastic supply curve; in other words, the supply is assumed to meet demand. Another significant drawback of the SIMFARE-C model is its great size and complexity. Abt states that the interpretations of "...the results of any single run or pair of runs is very difficult without analysis of many other runs" [2, p. III-3].

Presently, Abt Associates is preparing a "National Day Care Center Supply Study" for the Department of Health, Education and Welfare. Their purpose is to update nationwide information on the characteristics of licensed day care centers. Abt proposes to provide a statistical profile of day care center industry by state. The profile will include:

- (1) general characteristics of day care centers
- (2) geographic distribution of centers
- (3) distribution of staff characteristics
- (4) financial characteristics
- (5) characteristics of families served, including income, number of children enrolled per family and percentage of mothers working [1, p. 3].

Abt proposes to design a model "to forecast the impact of alternative licensing regulations, alternative monitoring

and funding strategies and variations in local conditions" on the following variables [1, p. 4]:

- (1) licensed capacity
- (2) enrollment
- (3) number of paid staff and average wage
- (4) average cost of child care per child-year
- (5) average parent fee
- (6) total private-paid enrollment
- (7) numbers of profit and non-profit centers

The Abt supply study does not apply to the development of sliding fee systems. They plan to study available facilities and staff, not how a fee system would impact the day care system. In addition, Abt's scope is a national one, encompassing a large number of interrelated variables that might not be relevant in a state-level child care system. Their supply data are scheduled to be completed in Winter, 1978.

Summarizing, the literature research reveals very limited professional articles written on sliding fee systems for day care services. Only two reports specifically address sliding fee systems design. Cash's model is limited mainly by the assumption of a static environment. Abt Associates' study on sliding fee systems on a national scale limits the practicability and evaluation of the results, due to the large number of interrelated variables (about 400). Neither Abt nor Cash considers the dynamic nature of the day care environment

over time. The Abt Day Care Supply Study will focus on the national level. Its purpose is to update nationwide information on day care facilities, staff and programs. Hence, it will not apply directly to the design and evaluation of sliding fee systems.

1.5 General Methodology

The model is written in FORTRAN, so that it can be widely interpreted and run on as many types of computers as possible. It is a deterministic simulation and employs fixed-interval (one year) clock updating. The maximum run length is five years.

The major input variables include:

1. An initial matrix of the numbers of families cross-classified by income ranges and family size (one matrix for each of the ten geographic DHR Districts).
2. Factors by which the number of families in each cell of the family income/family size matrices are expected to change during each one-year update.
3. The distribution of children by age (i.e., infant, pre-school, elementary school) demanding and using day care services for each DHR District.
4. An assumed demand curve for child care services expressed in terms of the percentage of families demanding the service as a decreasing function of fees as a percentage of net real income (adjusted for loss of other benefits and increasing taxes).
5. The initial number of child care slots available by DHR District, and assumptions as to how that supply will increase over time. Four possible assumptions for the increase in supply are:
 - a. The supply will increase or decrease linearly at some specified slope.

- b. The supply will increase or decrease exponentially by some specified percentage in each one-year period.
- c. The supply will increase or decrease as a function of income received from fees.
- d. The supply will increase or decrease in response to demand.

This model utilizes the last method to adjust supply for the next time period.

- 6. Cost per child to the State of providing day care services as a function of child age and DHR District.
- 7. Schedules of benefits lost (e.g., food stamps, public housing, Aid to Families with Dependent Children, etc.) and additional taxes incurred as family income rises.
- 8. The sliding fee scale itself, expressed in terms of fees charged as a function of family income adjusted for family size. The sliding fee scale is based on an assumed percent of the maximum fee the State can charge based on average care cost per child for each DHR District.

During each one-year update of a simulation run, the following sequence of computational operations is performed:

- 1. Update the current supply of child care slots in each district.
- 2. Revise the family income/family size matrices for each of the DHR Districts.
- 3. Determine the demand for day care services by family income range and child age in each district.
- 4. Determine the total cost of services provided, the fees paid by participating families, and the cost to the government.

The results of the above computations are printed at the end of each update.

CHAPTER II

MODEL DESCRIPTION AND BASE RUN

2.1 Technical Overview and Limitations

Appendix A provides definitions of all model variables and a complete listing of the computer program. This information should be useful in model maintenance and in any further model development efforts. Appendix B provides documentation required by the user in actually running the model. Specifically, it shows the formats for inputs and methods for controlling the length and output produced in each run. It is assumed that anyone attempting to use the documentation in Appendix A or B would be familiar with the operational characteristics of the model as described in detail in the next section.

In addition to the assumptions that are presented in the last section of this chapter, the model has several general limitations that are technical in nature:

1. The model accounts for only one facet of family eligibility for public day care services. Eligibility for Title XX services is determined by one of the following categories [7, pp. 24-25]:

- a. Persons receiving assistance under the Aid to Families with Dependent Children program (AFDC)

- b. Persons receiving benefits under the Supplemental (Social) Security Income program (SSI) or state supplemental payments.
- c. Persons whose family income, adjusted for family size, is less than 80 percent of the State median income.

This model determines family eligibility from the adjusted median income only. Recipients of AFDC and SSI benefits overlap with income-eligible families. Hence, income should be the dominant factor determining family eligibility for public child day care services.

2. Eligibility priorities, as established by the "Contract Services Policy Issuance 76-23" dated December 1, 1976, are [6]:

- a. DFCS referrals
- b. AFDC working mothers
- c. Income eligible working mothers
- d. Other eligibles under Income Scale I
- e. Former clients

However, the model establishes day care service priorities as follows:

- a. DHR income eligible children demanding public child day care services on a free basis (family income is less than 61 percent of the state adjusted median income).
- b. DHR income eligible children demanding public child day care services on a fee basis (family income is between 61 and 80 percent of the state adjusted median income).
- c. Non-DHR income-eligible children demanding public child care services on a fee basis (family income is greater than 80 percent

but less than 115 percent of the state adjusted median income). Federal regulations allow states to provide public child day care services on a fee basis for eligible children. The State of Georgia presently does not offer this service in this category. The model, then, can serve as a planning tool for DHR to provide day care services to children in this income category.

Further refinements of the model could statistically include the five DHR eligibility priorities.

3. The supply schedule represents available contracted slots (spaces) for public day care services on a DHR District level. The supply schedule could be expanded to incorporate geographic areas of importance within districts (e.g., to study major problem areas; isolate growing urban and metropolitan areas, such as Macon, Columbus, Augusta, Valdosta ...).

4. The model does not account for less than full-day users of public child day care services. National sample statistics show day care usage has the characteristics as follows:

CHILDREN RECEIVING DAY CARE CENTER CARE

<u>Use Mode Category</u>	<u>% Users</u>	<u>Age Groups</u>		
		<u>3 yrs.</u>	<u>3-5 yrs.</u>	<u>6-13 yrs.</u>
Casual (10 hrs/wk)	17.6	27.8	42.8	29.4
Moderate (10-29 hrs/wk)	26.2	16.2	38.3	45.5
Heavy-full (30+ hrs/wk)	56.2	9.6	64.5	26.0
TOTAL - all children	100.0	14.5	53.8	31.7

The model, however, assumes that all users are full-time.

5. The exact cut-off points of 61, 80, and 115 percent of the State adjusted median income for family eligibility are compared with family income levels rounded down to the nearest \$1,000 per year. Further refinements of the model could treat these cut-off points more precisely.

2.2 Detailed Description of the Model

2.2.1 Model Overview

The model is divided into seven computational phases. Figure 2-1 presents an overview of the logical sequence of the seven phases. Generally, the input data consist of socio-economic/demographic statistics, family income benefits and expenses, day care demand schedule, day care supply (slots), public day care benefits, costs and parameters, and factors which will change the supply and demand of day care services through time.

Phase 1 transforms available census data into socio-economic family and children distributions throughout the State. It also segregates these socio-economic distributions into ten geographic areas which correspond to the ten Department of Human Resources (DHR) Districts.

Phase 2 constructs the model income and economic parameters. The model creates the sliding fee scale from the day care costs and the relationships of fees to costs that were

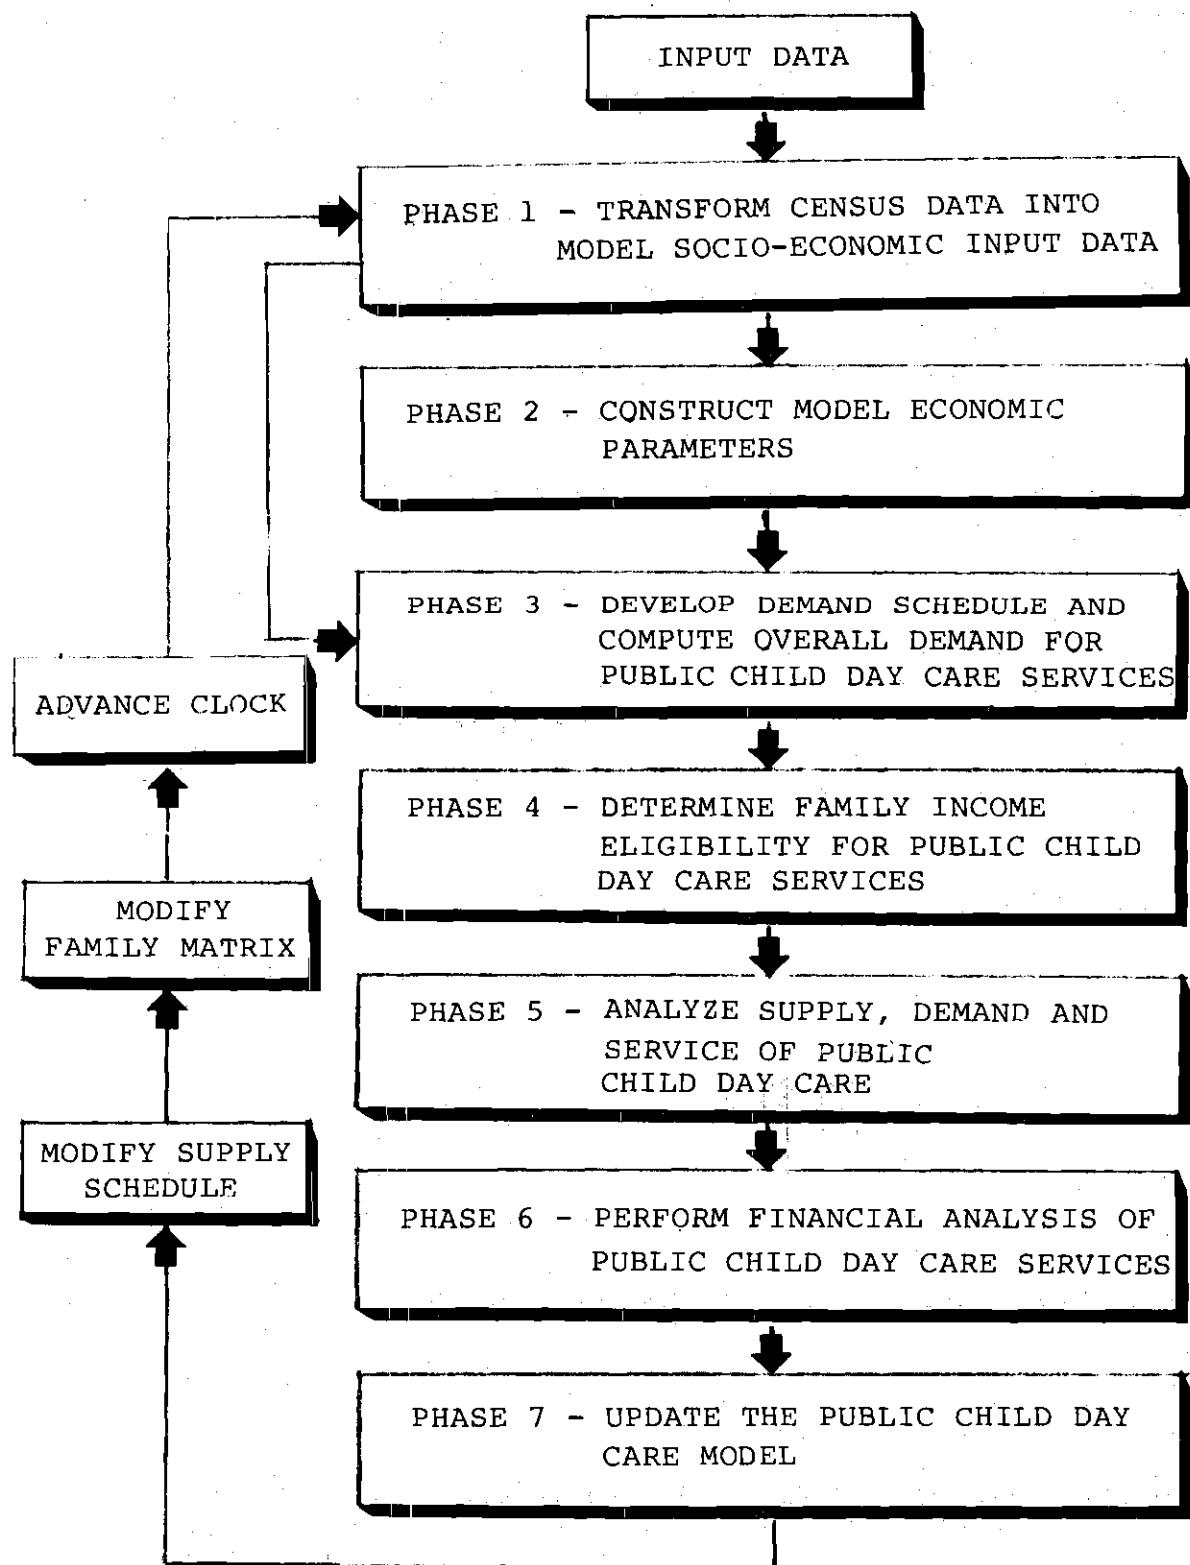

FIGURE 2-1. OVERVIEW LOGIC DIAGRAM

inputs to the model. Based upon the expected day care fees per family, together with other costs and benefits derived from public agencies, a family's real net income is computed. The day care fees and the real net income per family are computed separately for a matrix of 13 family income brackets by 10 family sizes. The real net income and expected day care fees for a family are the determining factors for the demand of public child day care services.

Phase 3 computes the total demand for public day care services from the demand schedule. The demand schedule is defined by input coordinates. The ratio of the expected fees per family to real net family income is the independent variable. These ratios with the demand curves determine the percent of families demanding public child day care services for each family size and income combination. The model then calculates the number of families that demand public child day care services regardless of their eligibility for the service under Federal and DHR regulations.

Phase 4 determines eligibility for public child day care services. The model makes this determination by comparing family income level and family size in each geographic region (DHR District), with a pre-determined income eligibility category. The income eligibility categories are fixed by Federal and DHR regulations and policies that dictate the family income cut-off points. The number of income-eligible families are converted to the children demanding the service

in three public day care service categories. These three day care service categories identify children (1) eligible for free day care, (2) eligible for day care on a fee basis, or (3) not presently eligible on a fee basis in Georgia, but eligible by Federal regulations.

Phase 5 analyzes the demand for public day care services. The number of children demanding public day care for each of the three day care service categories is compared to the available contracted spaces in each DHR District. The model establishes service priorities allocating slots in the following orders:

1. children demanding day care on a free basis
2. children demanding day care on a fee basis who are income eligible by present DHR policies
3. children demanding day care on a fee basis who are not eligible under present DHR policies but eligible under Federal regulations.

Phase 6 determines the financial implications to government and participating families on a DHR district and state basis of providing public child day care services. Day care costs are computed by children's age groups. Fees received by the State are calculated and compared with total operational costs to determine the net costs to the government for providing day care services.

Phase 7 alters several variables in the model which are assumed to change over time. The simulation clock advances in one-year increments. At the end of each year, the model

increases or decreases the available public day care contracted spaces (supply) as a function of demand in the previous year. The model also changes (increases, decreases) the number of families in a specific socio-economic level by fixed percentages.

The simulation clock is then advanced by one year, and control returns to Phase 1 to repeat the computational process. After the first year, however, it is not necessary to perform Phase 2, so control passes from Phase 1 to Phase 3.

The model can be run for any desired number of years. Due to the inherent inaccuracies in such a model, however, runs of more than five years are not recommended.

2.2.2 Technical Details of the Model and Base Run

Input Data and Variables. Appendix B describes in detail the mechanics of entering the input data. The model uses 30 input variables. The values of most of the input variables are printed with the output for the first simulated year. Appendix A-1 contains an alphabetical listing of all variables cross-referenced to the computational phase of the model where it appears. Appendix A-2 defines the variables alphabetically within the seven computational phases of the model. The input data and variables are discussed within the appropriate computational phase. The complete computer program appears in Appendix A-3.

The model will be described together with the input data and results of the "base run". The input and output

data of the base run are in Appendices D through L. The base run was made using available socio-economic and demographic data, together with assumed data where the information was not readily available. The base run will show the interrelationships of variables and the flexibility of the model. It also provides a benchmark from which to perform sensitivity analysis. Where similar but multiple tables are printed by the model, the thesis only contains a representative sample of the tables.

Phase 1 - Transforming Census Data into Model Socio-Economic Input Data. Phase 1 combines and transforms available demographic data into a form required by the model. Figure 2-2 shows a simplified logic diagram of Phase 1. The flow diagram also shows the variable names involved, the appendices where base run data can be found, and the line numbers in the FORTRAN program where the operations are performed.

The Total Families by Income Levels and DHR Districts (TFYD - Appendix D) matrix provides the basic socio-economic and demographic data for the base run. These data were derived from the 1970 Census of the Population [9, Table 124]. DHR has divided the State into ten districts (Appendix C). Each of the districts has unique demographic and socio-economic characteristics. Hence, the county data were grouped into the ten DHR Districts. The initial family socio-economic matrix shows the number of families by districts and family

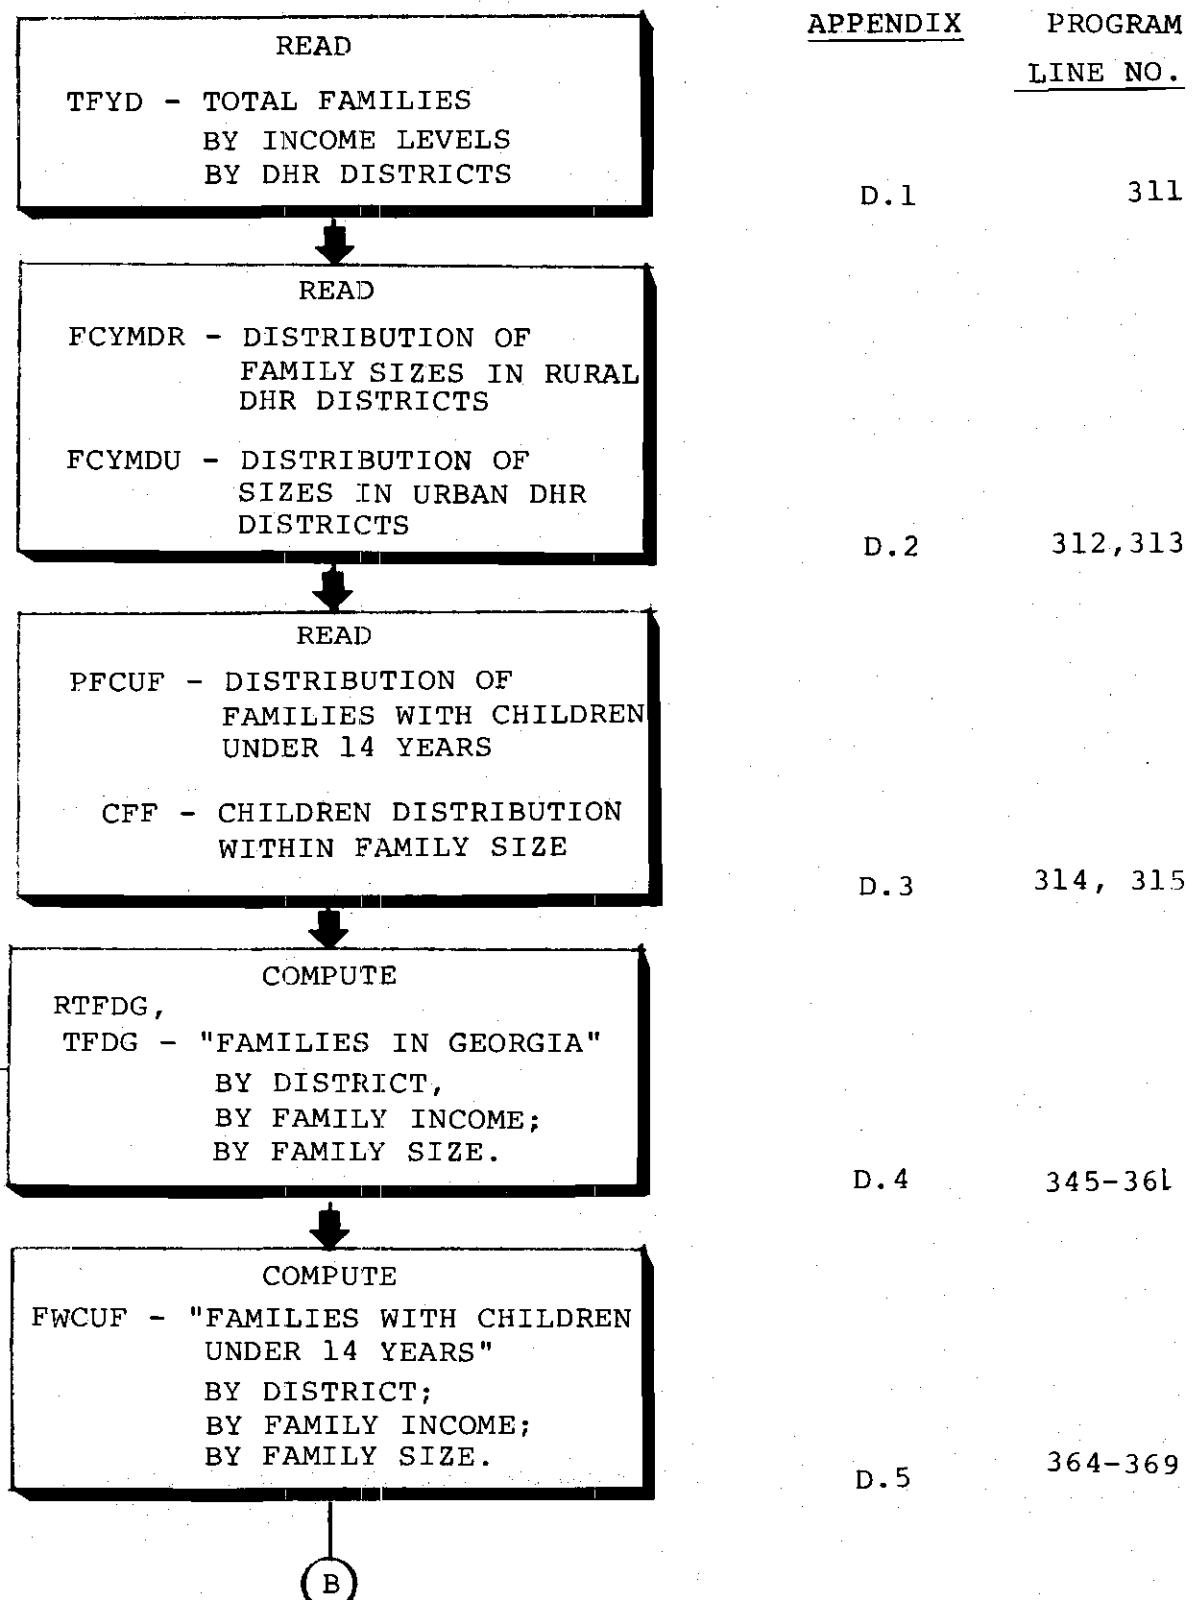

FIGURE 2-2. LOGIC DIAGRAM-PHASE 1

income levels.

The Distribution of Family Sizes in Rural DHR Districts (FCYMDR - Appendix D-2) matrix provides the factors for the base run by which family sizes are distributed in each income level. The Distribution of Family Sizes in Urban Districts (FCYMDU - Appendix D-2) matrix shows similar data but applies to the urban DHR District (i.e., District 3 - the Atlanta area). These data [9, Table 199] are inputs to the model.

The base run Families in Georgia matrix (TFDG - Appendix D-4) is computed by multiplying the Distribution of Family Sizes by the Total Families matrix. Therefore, the Families in Georgia matrix is classified by DHR Districts, by family income level and by family members.

The Distribution of Families with Children under 14 Years (PFCUF - Appendix D-3) was derived from national sampled statistics [10, NCCS, Table III-7]. The Children Family Factor (CFF - Appendix D-3) assumes that a family size of one member consists of one adult and no children. A family size of two consists of one adult and one child under 14 years of age. Family sizes of three to ten members consist of two adults and the remainder are children under 14 years of age. Both variables are inputs. The Children Family Factor is used later in the model to derive the number of children demanding public child day care services in each of the DHR Districts.

The Families with Children under 14 Years Old (FWCUF - Appendix D-5) for the base run is computed by multiplying the Families in Georgia matrix by the Distribution of Families with Children under 14 Years. This will be the basic matrix to determine families and children demanding public day care.

Phase 2 - Constructing Model Economic and Income Parameters. Phase 2 computes the real net family incomes for a "typical" family in a specific DHR District, income level and family size. The real net family income is then used as a factor to determine demand for public child day care services. Figure 2-3 shows the logic diagram for Phase 2.

The parameters used to compute real net family income are:

1. Income Tax Liability
2. FICA Withholding
3. Expected Public Child Care Fees Per Family
4. Medicare Program Benefits
5. Public Housing Program Benefits
6. Aid to Families with Dependent Children Program Benefits
7. Federal Food Stamp Program Benefits
8. Average Income

The base run uses estimated and assumed data for some of the income parameters. Some of the data were not readily available in useable form. Nevertheless, the data are consistent in terms of their relationships with family size and

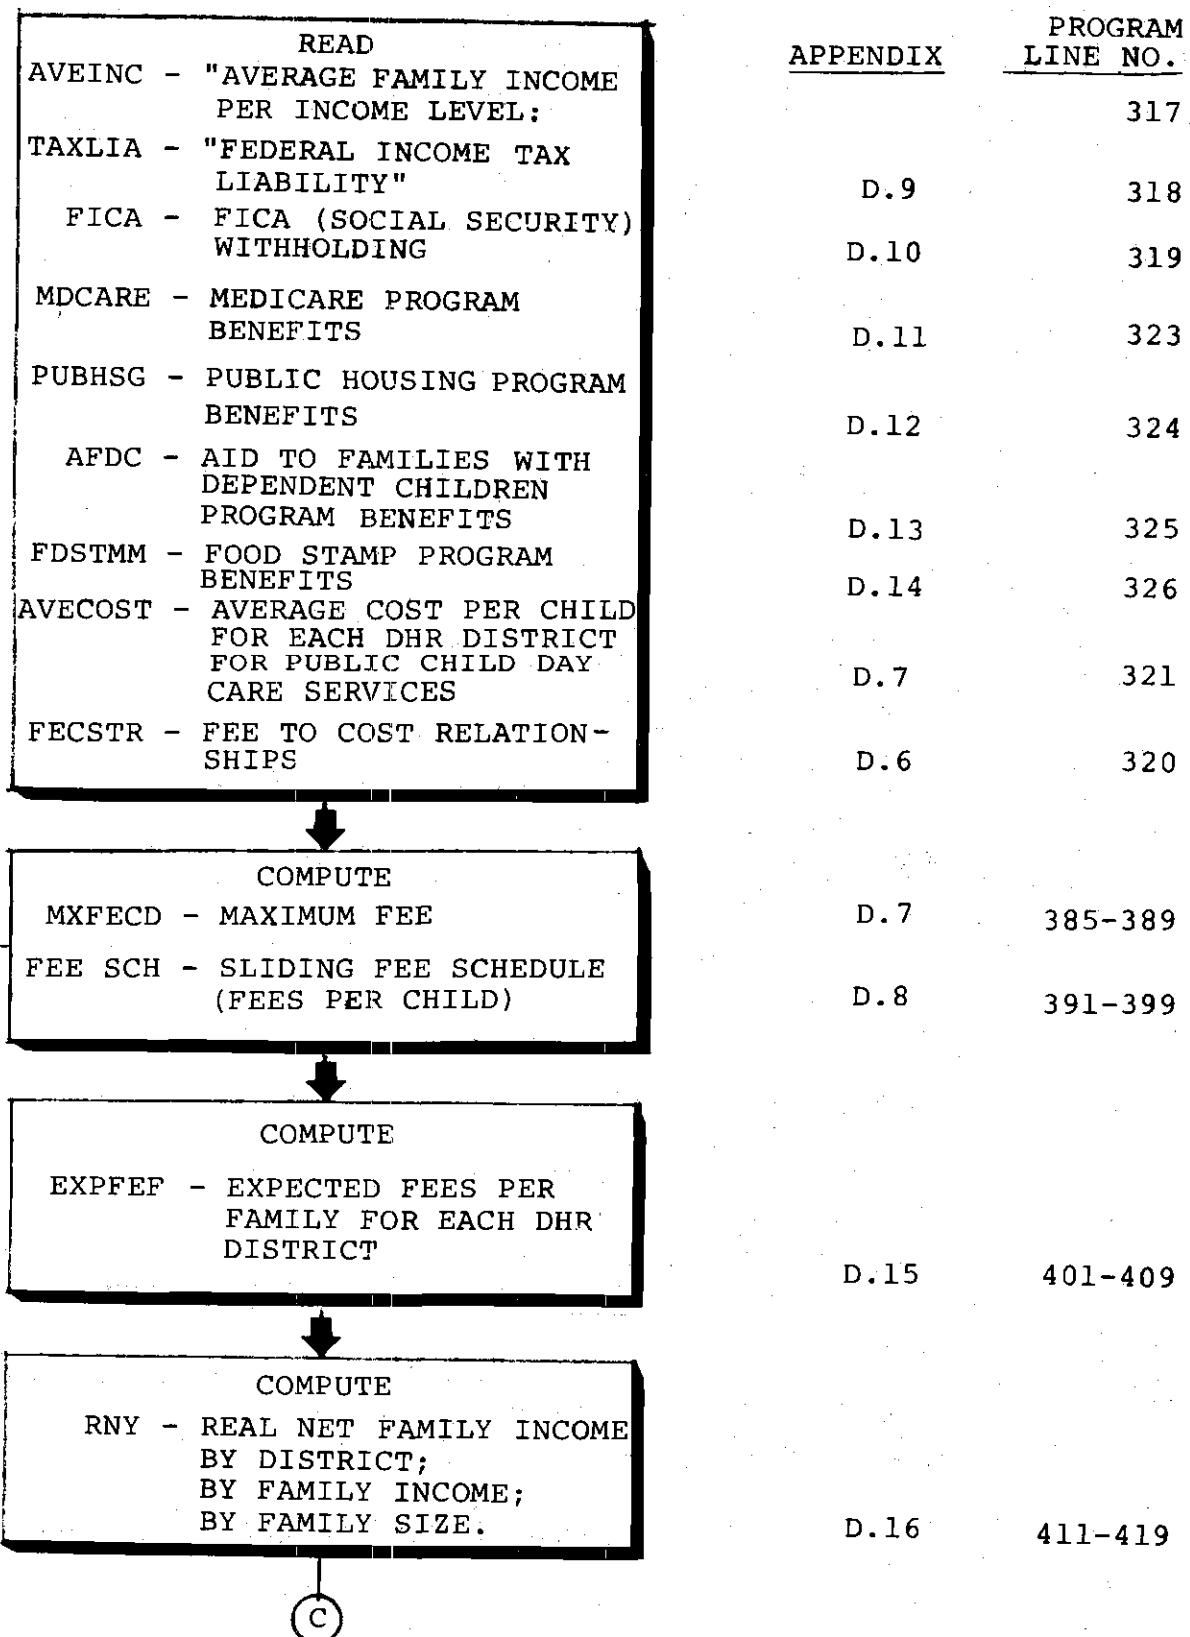

FIGURE 2-3. LOGIC DIAGRAM-PHASE 2

family income, and have been judged "realistic" for model testing purposes by DHR personnel.

Income Tax Liability (TAXLIA - Appendix D-9) is calculated from the 1976 Federal income tax tables and excludes all state and local taxes. The computations assume a married couple filing a joint tax return.

FICA Withholding (FICA - Appendix D-10) from wages are estimated values that employers withhold for Social Security taxes.

The Expected Public Child Day Care Fees per Family (EXPFEF - Appendix D-15) are computed by the model. The model assumes these fees to be for full-day child care. It also assumes that the maximum fee per child is the average full-day child care cost per child for a particular district. The expected public child day care costs are shown in Appendix D-7. The procedure by which these figures are computed is explained in detail later in this section.

Medicare Program Benefits (MDCARE - Appendix D-11) increase the real net income for Medicare-eligible families. The Medicare benefits used in the base run are assumed.

Aid to Families with Dependent Children Program (AFDC - Appendix D-14) benefits also increase the real net income. AFDC benefits used in the base run are assumed, since neither H.E.W. nor DHR could readily supply the data.

Public Housing Program benefits (PUBHSG - Appendix D-13) primarily apply to lower income families and can significantly change real net income. These benefits were also assumed

for the base run.

Federal Food Stamp Program benefits (FDSTM - Appendix D-12) enable low income families to purchase food items to improve their diets. Food stamps are purchased by eligible families based on their family size and net income. The "maximum purchase requirements" [11, FNS-70] were converted into family income benefits. Average income is the arithmetic average of the family income level range.

The Title XX Plan for Georgia [7] provides social services to low income families that increase their real net income. These benefits could be quantified and incorporated into the model, though they tend to relate to special or transitory family situations. Services provided by the Title XX Plan are:

1. Adoption
2. Child Care Services
3. Chore and/or Homemaker Services
4. Day Care for Adults
5. Employability Services
6. Family Planning Services
7. Foster Care for Children and Adolescents
8. Health Related Services
9. Home Delivered or Congregate Meals
10. Home Evaluation and Supervision
11. Home Management and other Functional Educational Services

12. Information and Referral Legal Services
13. Protective Services for Adults
14. Services to Expectant Parents
15. Protective Services for Children
16. Special Day Care and Training Services
17. Special Services to Children and Youth
18. Evaluation of Vocational Potential and Transportation Services

Other Federal benefits, including Supplemental (Social) Security Income and income tax deductions for day care expenses, are not taken into account in the model.

The Real Net Family Incomes (RNY - Appendix D-16) are calculated for each income level and family size combination within each district. This variable is computed by subtracting taxes and expected child care expenses (fees) from an average income in a specific income level and adding other benefits to yield the real net family income.

The Real Net Income computations for the base run show the significant effect that government benefits have on the real net family income. For example, with estimated and assumed income benefit data, the income level of \$5-5,999 for District 3 shows real net family income ranging from \$4,900 to \$11,182, depending on family size. The table also shows the notch effect or real net income drop for a given family size as gross family income increases.

The Sliding Fee Schedule (FEESCH - Appendix D-8) is

assumed to be a function of the average public child day care cost as the maximum fee that can be charged, in accordance with Federal regulations [5, pp. 5860, 8228, 62(c)(iv)]. The Average Cost per Child (AVECOST - Appendix D-7) was computed from the Georgia Title XX Plan for 1977 by dividing total expenditures by total children served. These average care costs per DHR Districts are taken as the maximum fee (MXFECD - Appendix D-7).

The Sliding Fee-to-Cost Proportions (FECSTR - Appendix D-6) show the relationship of fees to be charged in each family size and income category to the maximum allowable fees for each DHR District.

These fees-to-cost proportions, together with the public day care cost, are the determining factors for the public day care fees. The base run input data for the fees-to-cost proportions indicate zero values for DHR income-eligible children using public day care on a free basis. The non-DHR income eligible category is given values close to one. DHR income-eligible categories, using public day care on a fee basis, are given a range of values from .40 through .90 in order to ameliorate the income notch effect.

Phase 3 - Demand Schedule and Overall Demand for Public Child Day Care Services. Phase 3 constructs the demand schedule based upon three input coordinates. The demand schedule specifies the percent of families demanding public child day care services for a particular district, income level, and

family size. This phase computes the number of families with children under 14 years of age demanding service, regardless of eligibility. Figure 2-4 shows the logic diagram for Phase 3.

The demand for public child day care services was assumed to be a function of expected fees for child care as related to the net family income. Therefore, the independent variable in the demand function is the ratio of the Expected Public Child Day Care Fee per Family to Real Net Family Income (FETORY - Appendix E-1). The dependent variable, Percent of Families Demanding Public Child Day Care (PFDS - Appendix E-2) has an inverse relationship with the independent variable. The demand function consists of two negatively sloped intersecting straight lines. The input data consist of three pairs of coordinates necessary to define the demand function. The demand function used in the base run of this model is graphically portrayed in Figure 2-5.

The model calculates the slopes and intercept points to form the boundaries of the demand function. If the independent variable falls outside these boundaries, the dependent variable is set to zero. The percent of families demanding service is calculated for each District by family income and size. The model then computes the Families with Children under 14 Years Demanding Public Child Day Care Services (FCUFDS - Appendix E-3) by family income and family size for each District.

APPENDIX PROGRAM
LINE NO.

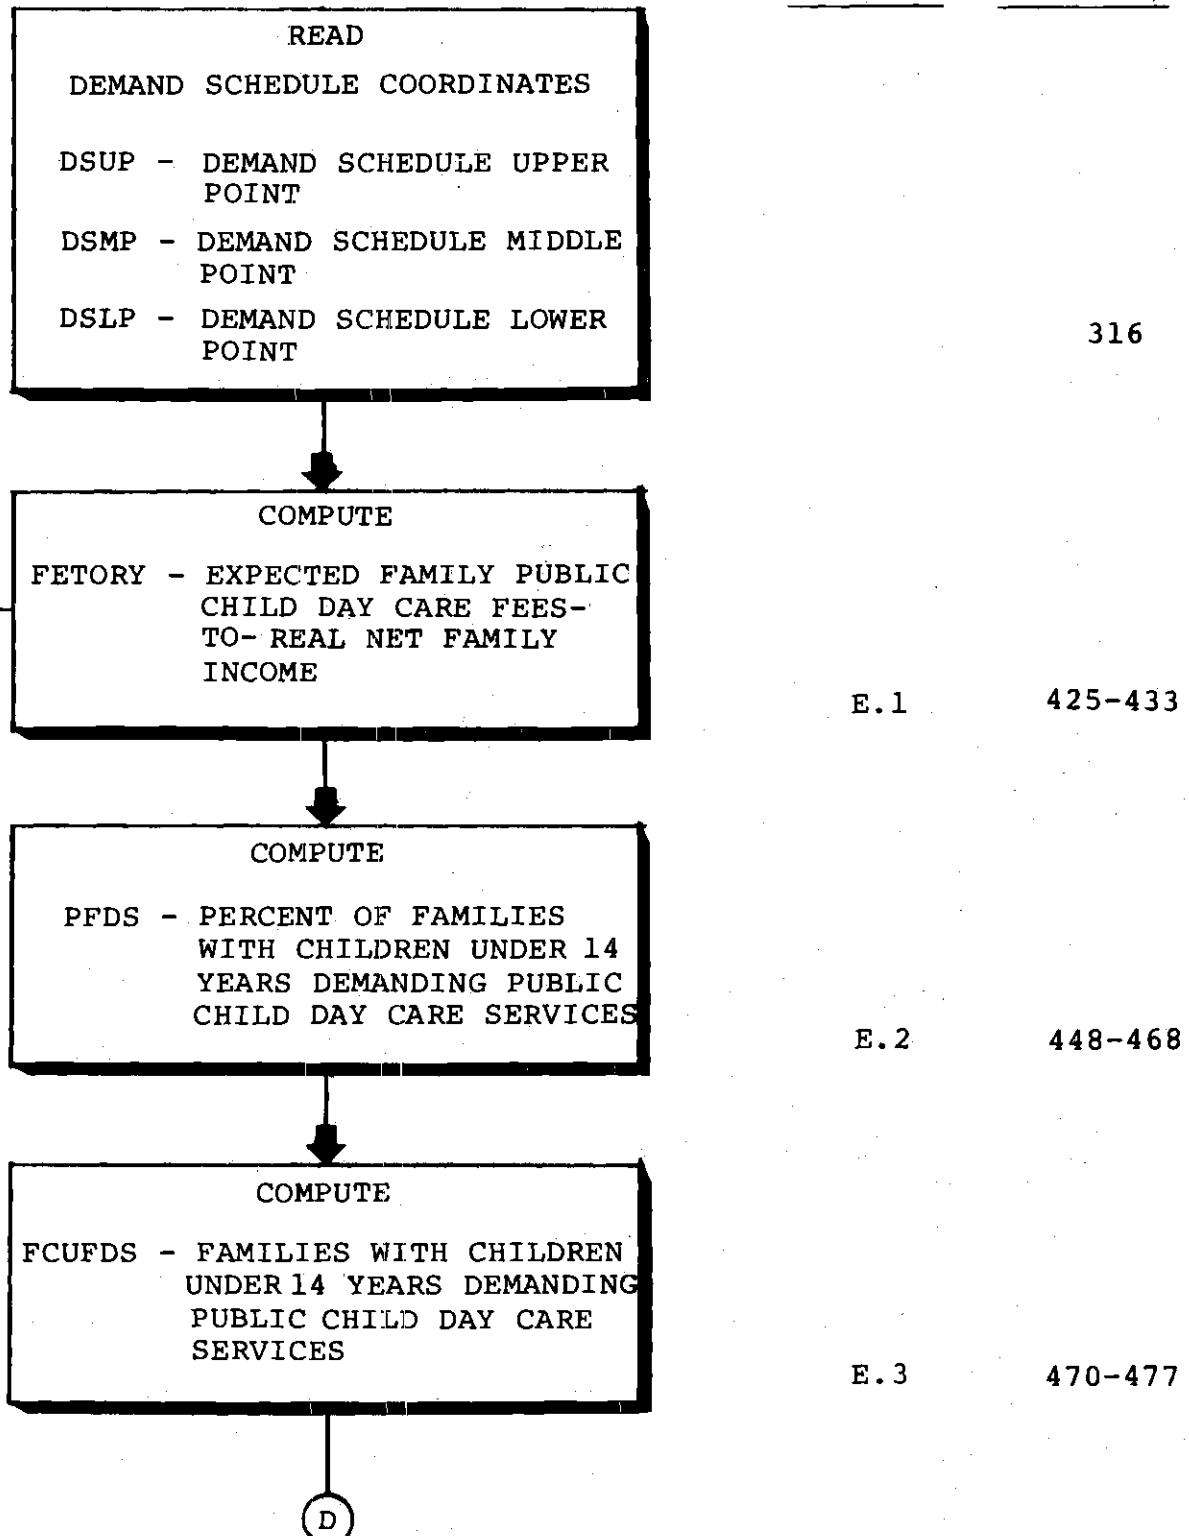

FIGURE 2-4, LOGIC DIAGRAM-PHASE 3

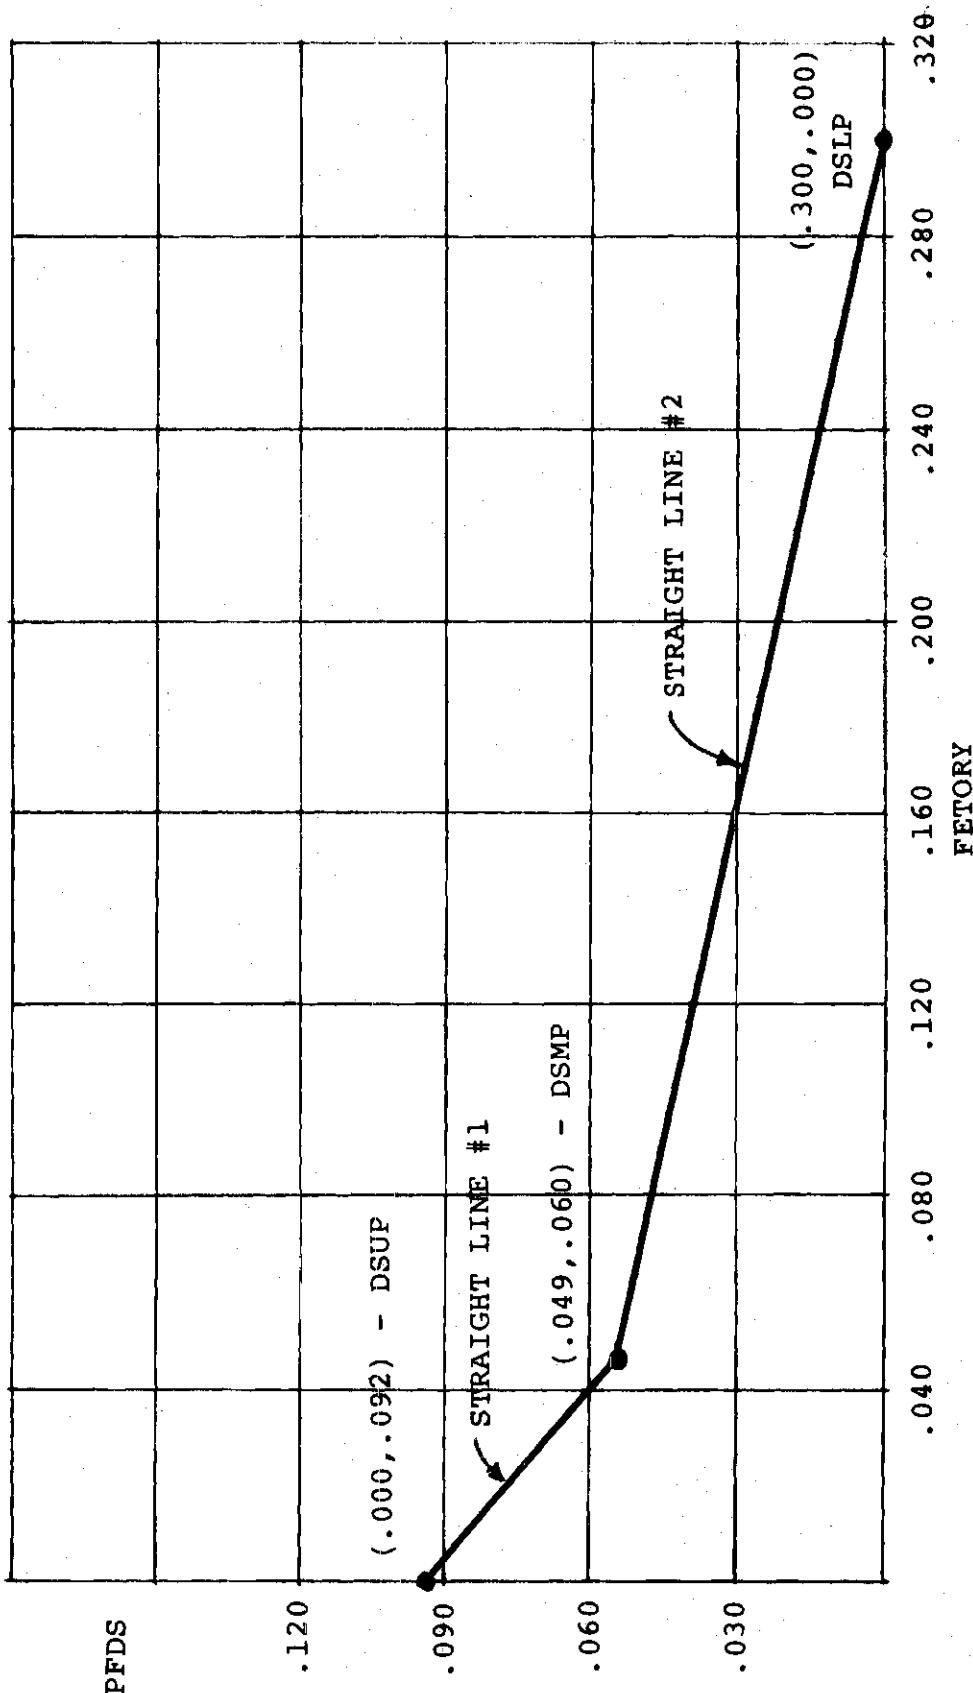

FIGURE 2-5. DEMAND FUNCTION

The Fee-to-Real-Net-Income Ratios for the base run show the effect of the sliding fee schedule as it compares with real net income. The expected fees for public day care become a larger percent of real net income as gross family income rises for a given family size. Urban (District 3) and rural (District 4) differences are apparent. District 3 ratios range from .13 to .50, while District 4 ratios range from .03 to .14. This pattern of ratios will determine the pattern of demand throughout the State.

Phase 4 - Family Income Eligibility for Public Child Day Care Services. Phase 4 screens the overall demand by applying the governmental income eligibility criteria. The model cuts off families demanding public day care by comparing an average rounded-off family income with three income cut-off points that are inputs to the model. Family demand is categorized into:

1. DHR income eligible demanding public day care on a free basis
2. DHR income eligible demanding public day care on a fee basis
3. Non-DHR income eligible demanding public day care on a fee basis.

Families demanding services are converted to children demanding day care by applying the Children Family Factor. The logic diagram for Phase 4 appears in Figure 2-6.

Federal regulation establishes criteria, parameters and guidelines for state governments to administer H.R.1, Title

PROGRAM
APPENDIX LINE NO.

PROGRAM
APPENDIX LINE NO.

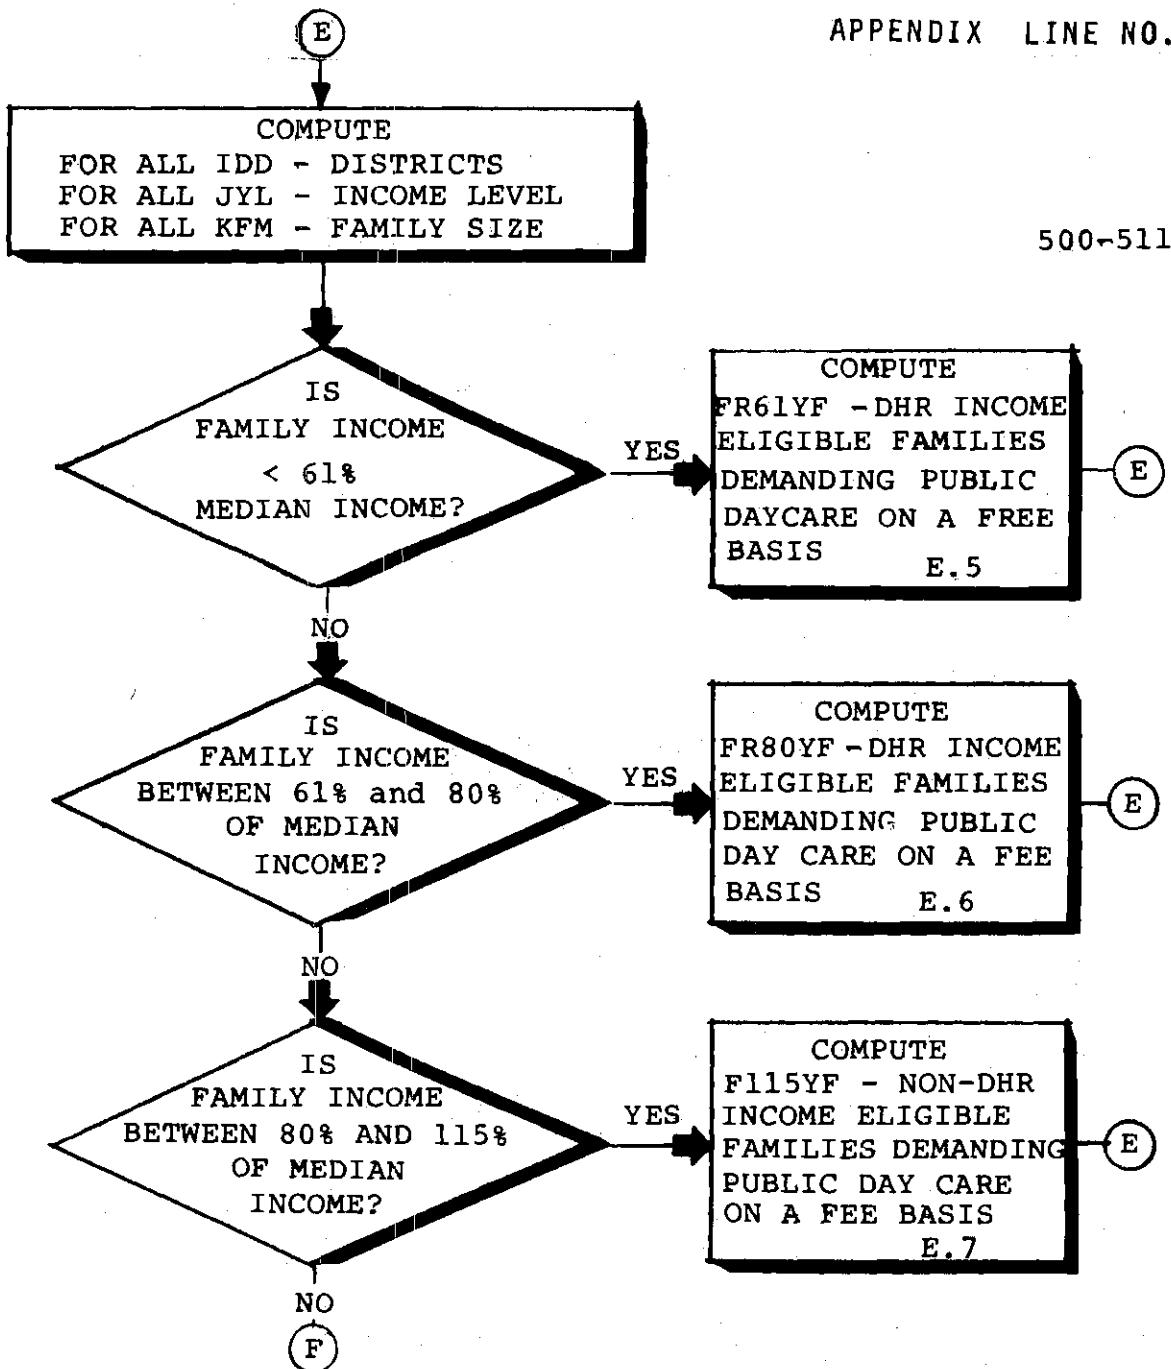

FIGURE 2-6A. LOGIC DIAGRAM-PHASE 4

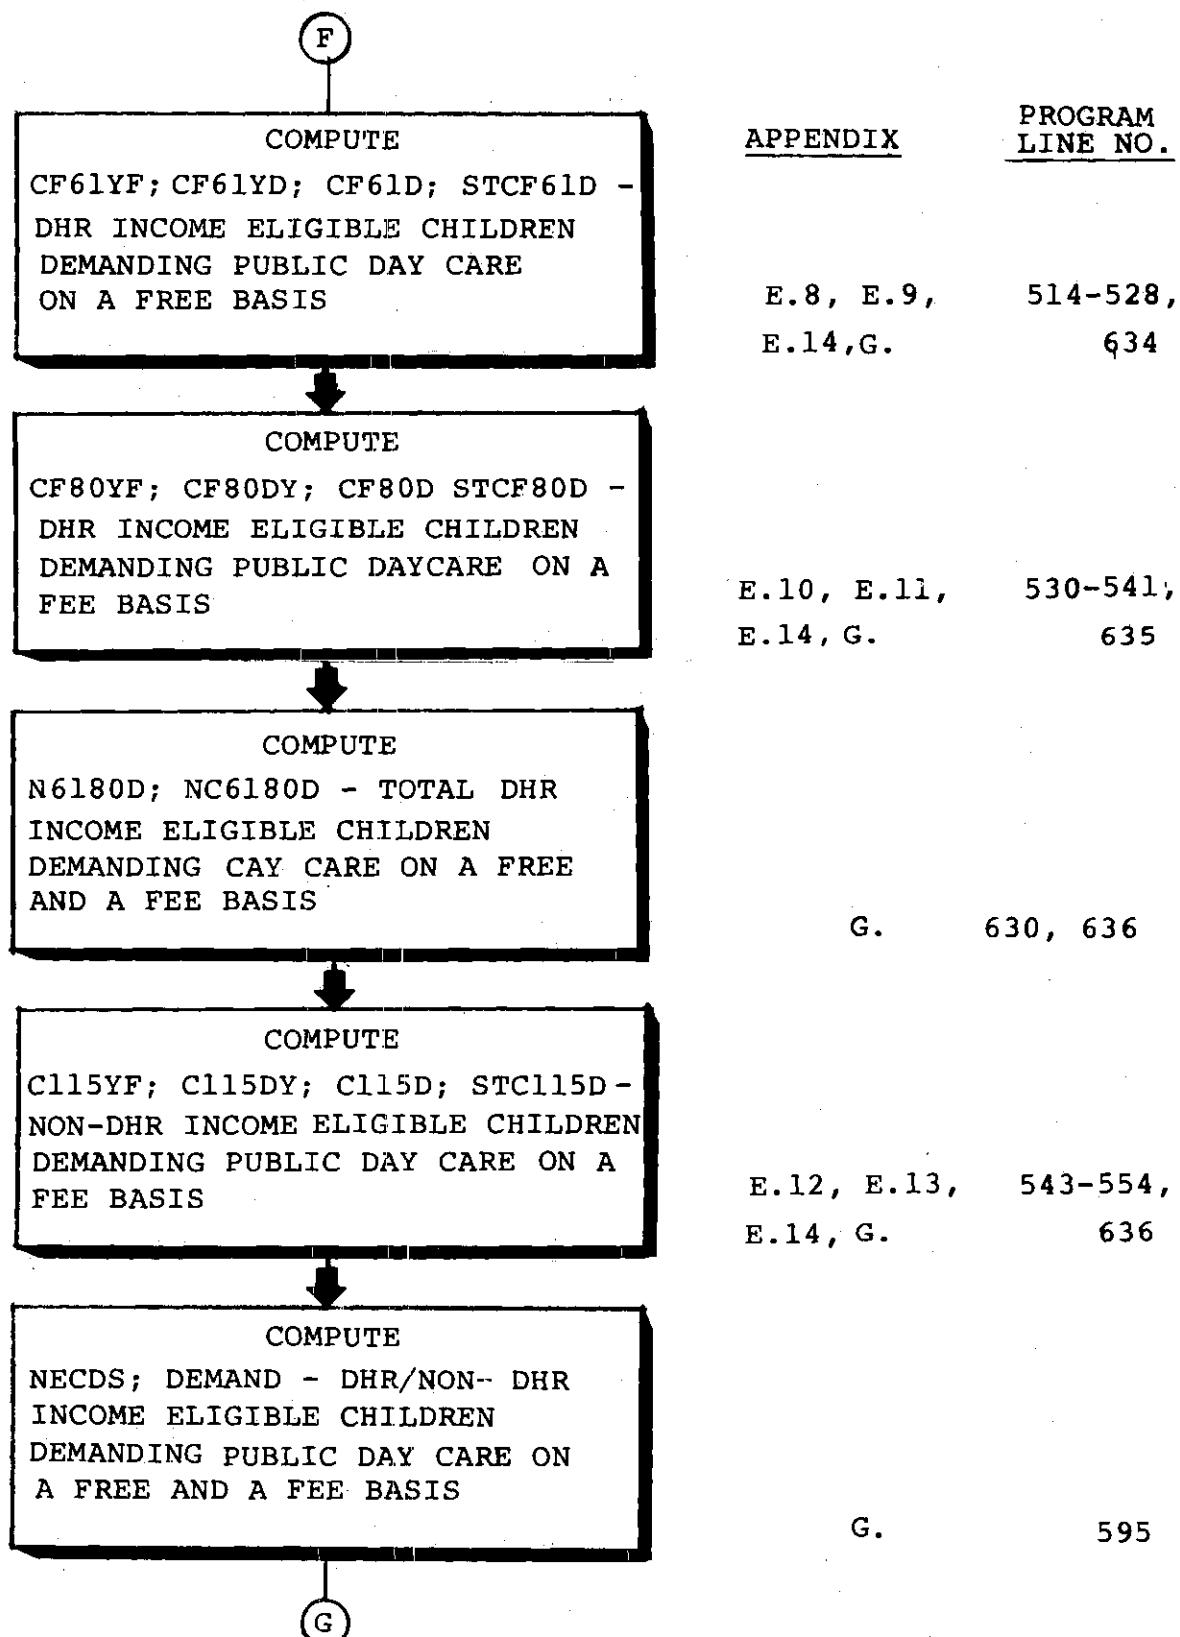

FIGURE 2-6B. LOGIC DIAGRAM-PHASE 4

XX benefits. These benefits can be offered to families who are eligible on numerous bases. Public day care eligibility can be determined on an adjusted family income basis. Federal regulations give the states the option of implementing a fee system which may vary with the participants' ability to pay. The states also have the discretion to establish eligibility cut-off points within the Federal guidelines. The following paragraphs describe the Federal regulations and Georgia's policies in regard to public child day care services.

The Family Income Eligibility Reference Table (FAMELG - Appendix E-4) is determined by the Federal and DHR Title XX regulations and policies. Income eligibility and the establishment of day care fees are based on the median income adjusted for family size. The State median income is the family income for a family of four as promulgated by the Secretary of HEW on or before December 1st of each year. Federal regulations [5, p. 5858 & 228.60(d)(2)] allow the State median income to be adjusted for family size. The Adjusting Income Family Size factors (ADJINC - Appendix E-4) are input variables.

Federal regulation [5, p. 5858 & 228.60(d)(1)] states "Individuals whose eligibility is based on income status shall be subject to imposition of a fee for service ... if their family's monthly gross income exceeds 80 percent of the median income of a family of four in the State ... and does not exceed 115 percent of the median income of a family of four

in the State, adjusted for family size". These are mandatory fees for eligible families.

The Georgia Department of Human Resources is presently operating under Title XX, §228.62(b) - Discretionary Fees. The Federal regulations allow the State to impose a fee to any individual who is income eligible and "whose family's monthly gross income is less than 80 percent of the median income of a family of four in the State, adjusted for family size..."

The model uses the DHR income eligibility cut-off points as input variables. This allows for future changes in these parameters to be introduced in the model. The base run uses the following cut-off points (PCMPIN - Appendix E-4) :

1. Public child day care service on a free basis - family income is less than 61 percent of the State adjusted median income
2. Public child day care service on a fee basis -
 - a. DHR income eligible: Family income is between 61 and 80 percent of the State adjusted median income
 - b. Non-DHR income eligible (but fee basis eligible in accordance with Title XX Federal regulations): Family income is greater than 80 percent but less than 115 percent of the State adjusted median income.

Therefore, the Family Income Eligibility Reference Table is constructed by adjusting the State Median Income by family size in accordance with Federal regulations at the Georgia DHR income cut-off points. Each cell of the Families with Children under 14 Years Demanding Service matrix is compared

to its appropriate category in the Income Eligibility table. Income eligible families demanding service are then segregated by category of Public Day Care service. The numbers of children demanding the service by eligibility category are computed by applying the Children Family Factor. Since urban districts have different demand characteristics than rural districts, the model adjusts urban demand by multiplying the children demanding service in District 3 by the Urban Density Demand Correction Factor (UDDDCF). The base run assumes this correction factor to be 3.075.

Phase 5 - Supply, Demand and Service Analyses of Public Child Day Care Services. Phase 5 performs two analyses. A Supply and Demand Analysis is made at District and State levels (Appendix F). A Demand and Service Analysis is a more detailed look at Public Day Care usage as it is further broken down by children age groups (Appendices G-1 and G-2). Figure 2-7 portrays the logic diagram for this phase. Each of the income eligibility categories is analyzed in four modes:

1. by Districts
2. by Districts and Age Groups
3. by Age Groups at State Levels
4. by State Totals

The available spaces for all public day care services is determined by the input variable - Supply Schedule (SUPSCH - Appendix F). The Georgia Department of Human Resources, Title XX Administration purchases child day care services

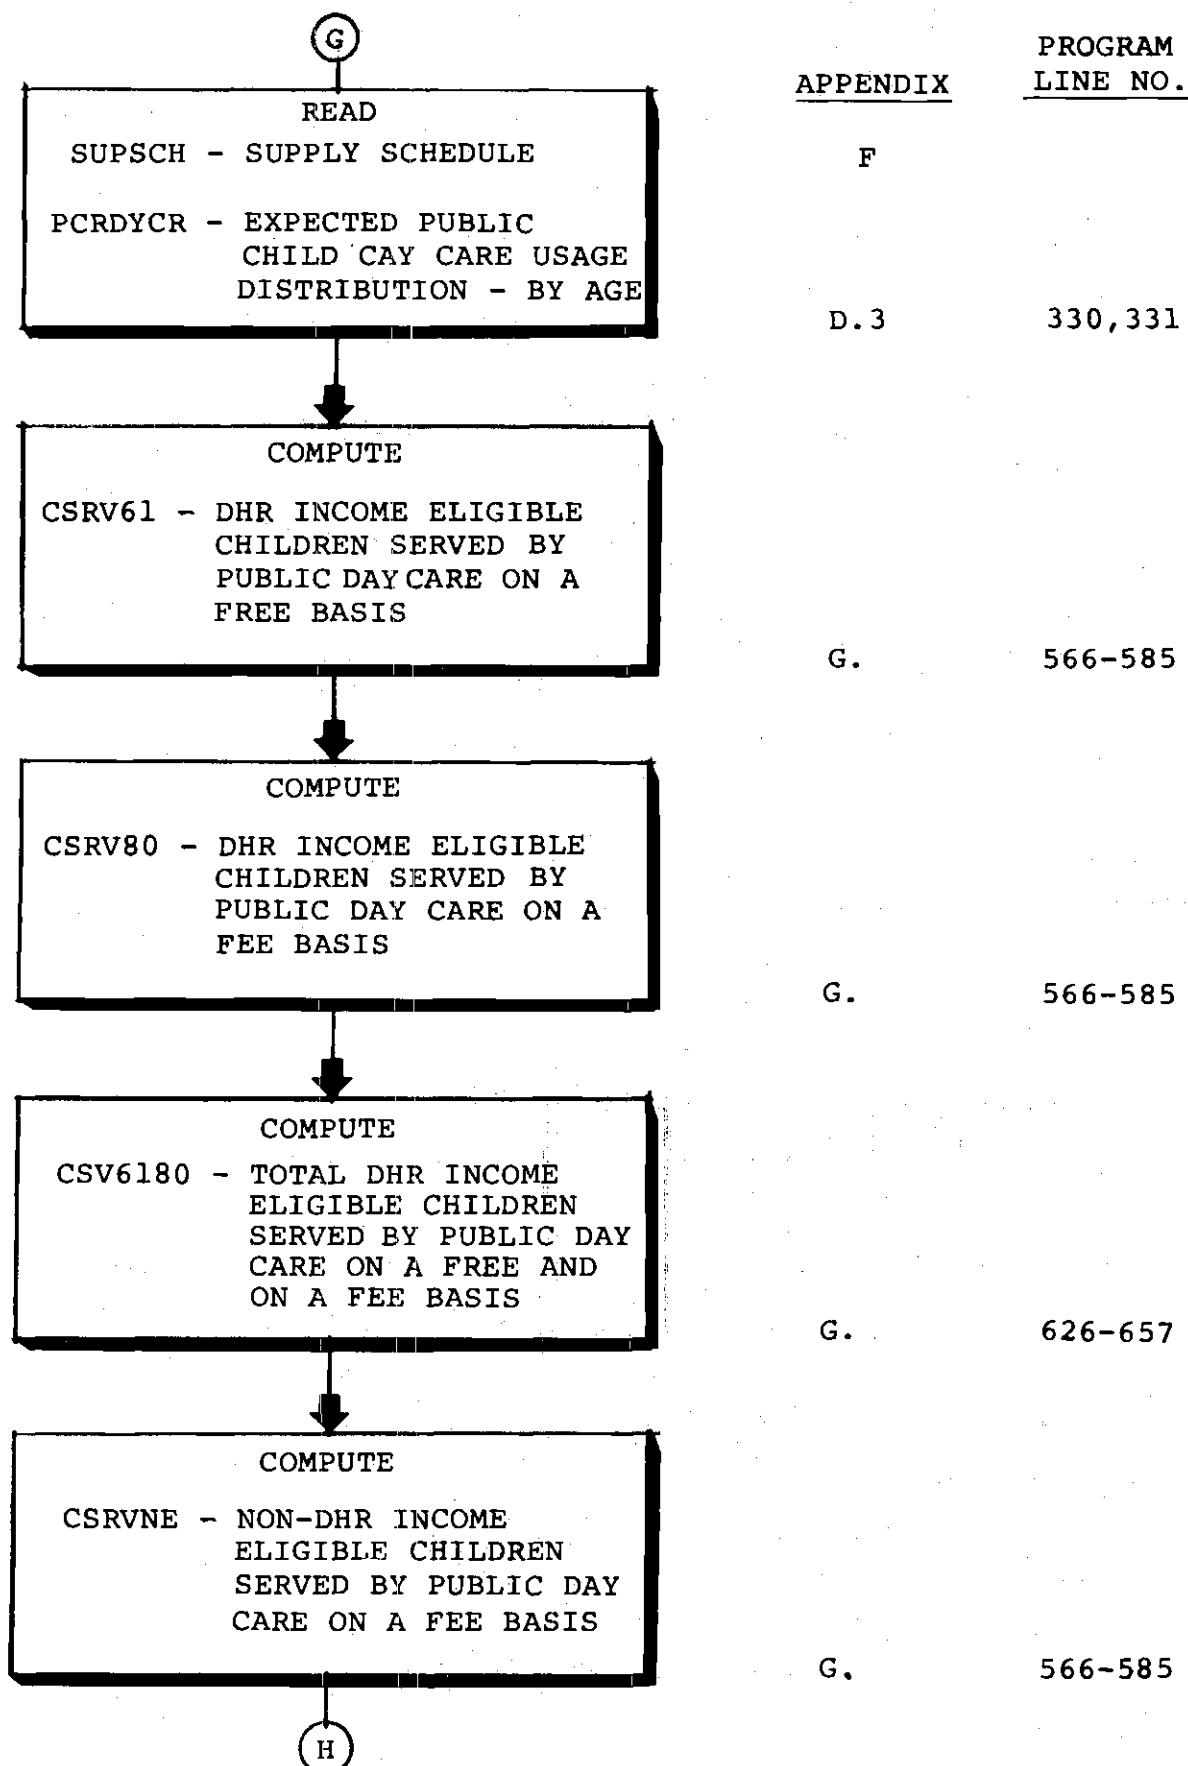

FIGURE 2-7. LOGIC DIAGRAM-PHASE 5

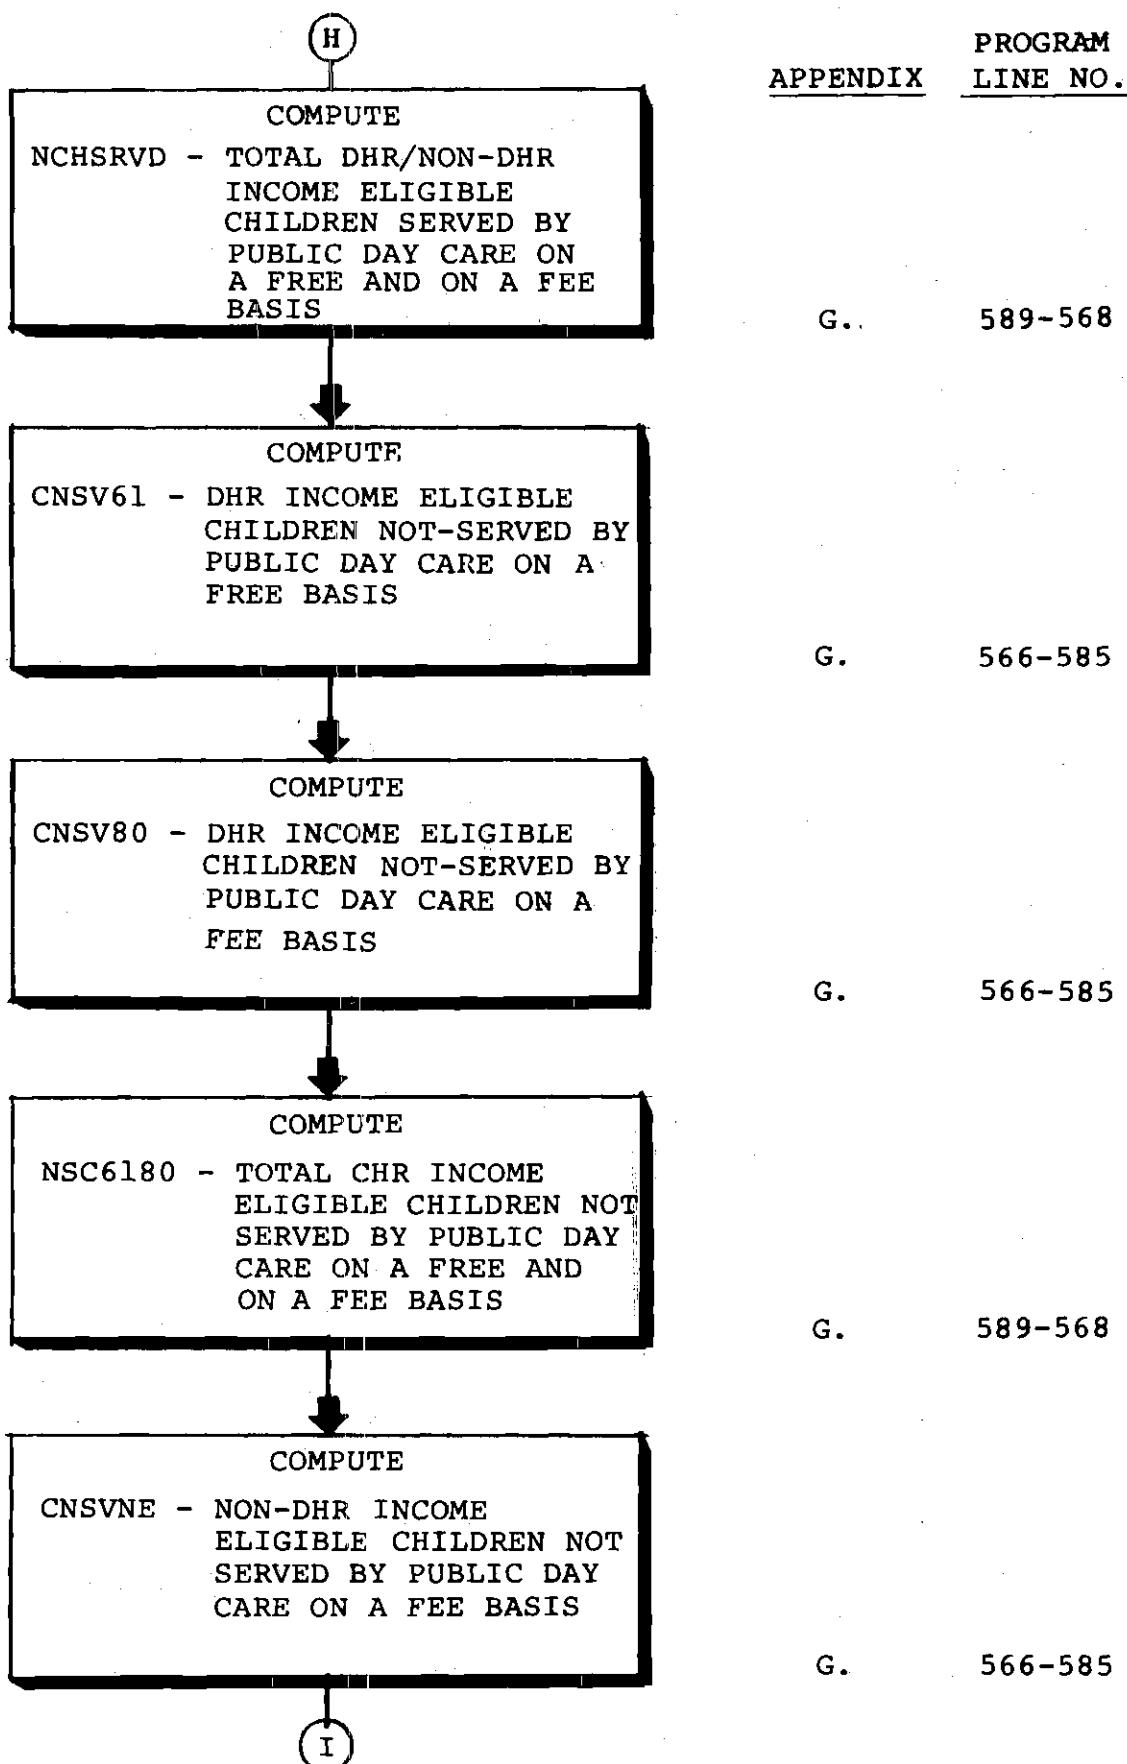

FIGURE 2-7A, LOGIC DIAGRAM-PHASE 5.

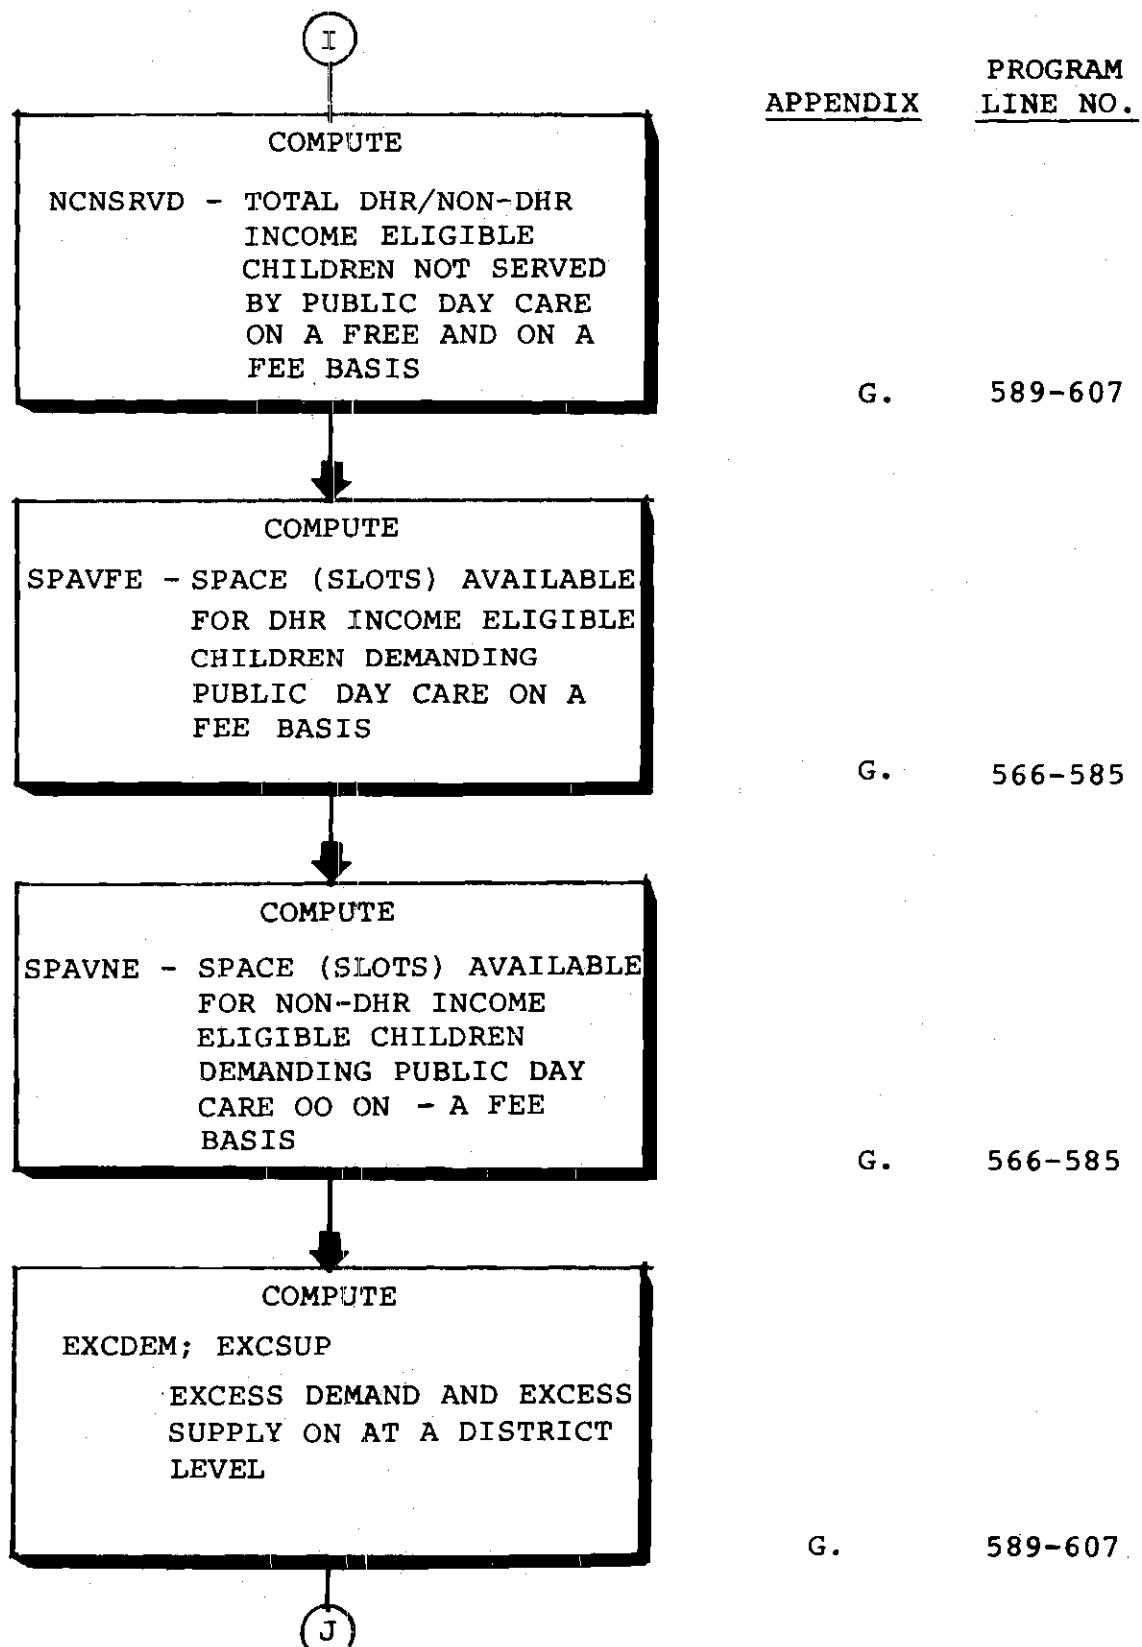

FIGURE 2-7B. LOGIC DIAGRAM - PHASE 5

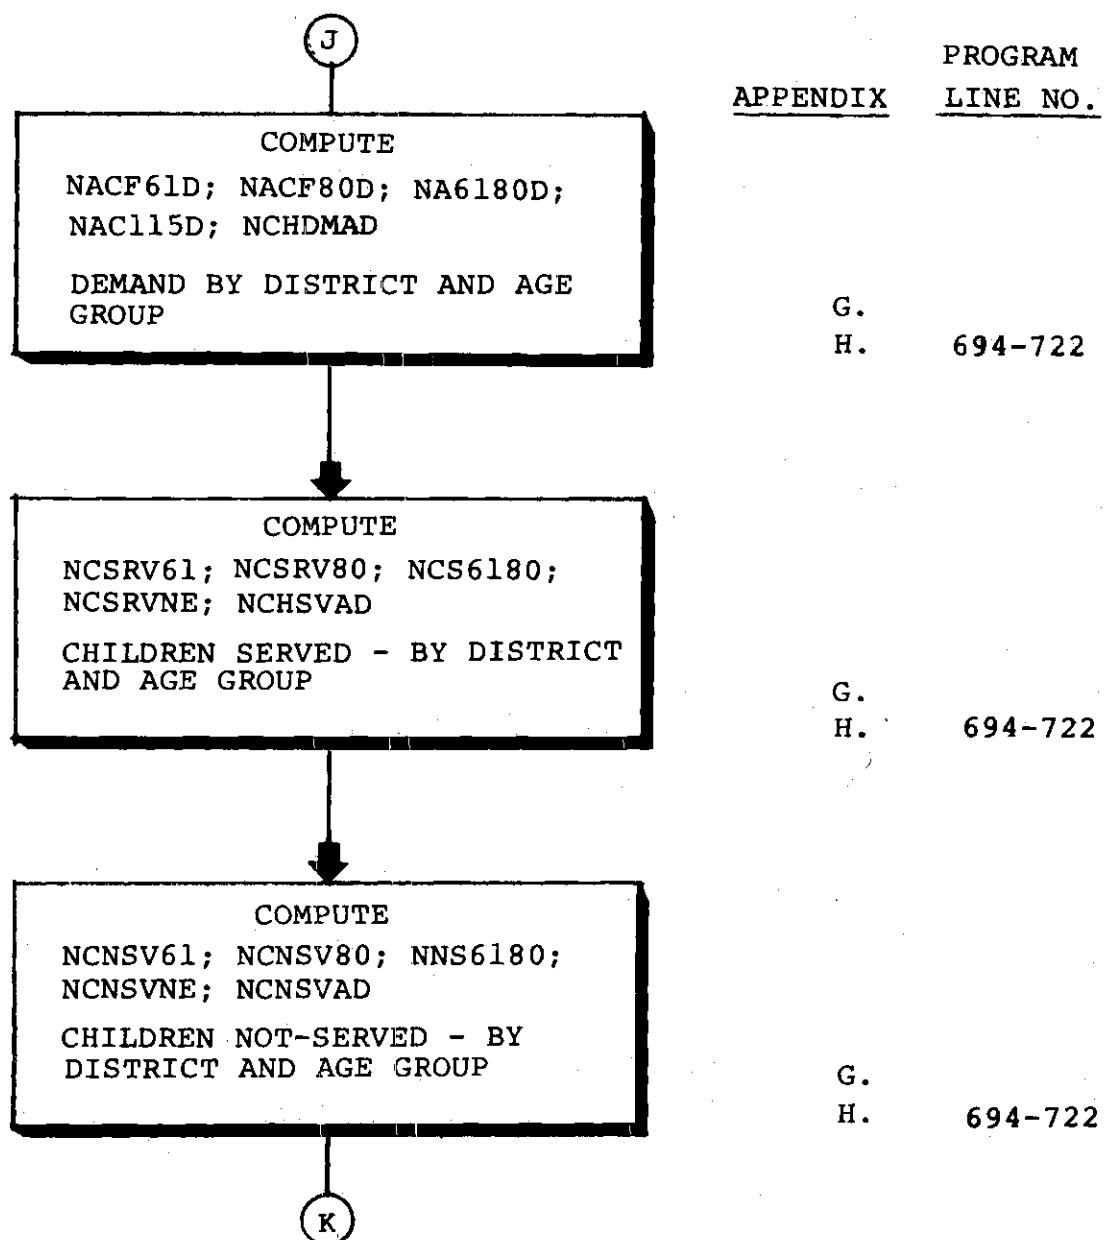

FIGURE 2-7c, LOGIC DIAGRAM-PHASE 5

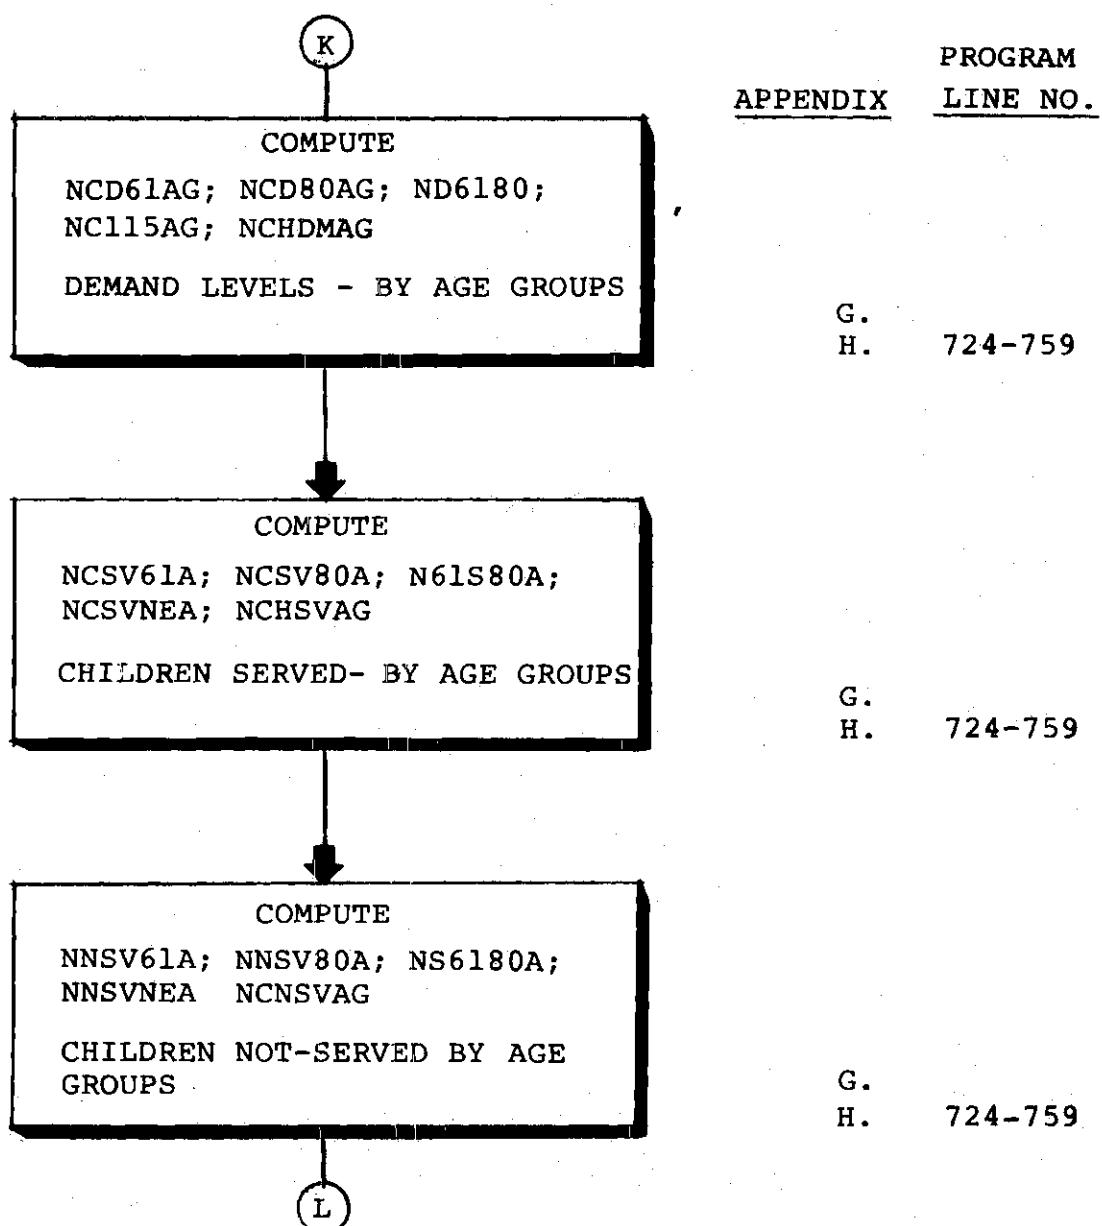

FIGURE 2-7D, LOGIC DIAGRAM-PHASE 5

(slots) from private businesses. The Contract Services Unit of DHR enters into annual written contracts with these private day care centers. Therefore, the Supply Schedule is based on an annual available contracted number of slots in each DHR District.

The model compares the demand for day care services for the three income eligibility categories with available slots (Appendix F). Excess demand or excess supply is also calculated by Districts and at the State level. The model first assigns the demand for free day care to available slots. In the base run, Districts 1, 2, 3, 4, 6, 8, and the State totals have total excess demand of 2102. The remaining Districts have excess supply. The available slots in Districts 5, 7, 9, and 10 are then offered to DHR income-eligible children demanding public day care on a fee basis. The base run shows that this eligibility category creates excess demand for all districts except Districts 5, 7, and 10 which show excess supply. The State shows an overall excess demand of 364. Supply and demand for these two income eligibility categories are summed to portray the present DHR policies.

A third income eligibility category is also computed to enable DHR to study the possibilities of offering public day care to children whose family income is between 80 and 115 percent of the adjusted State Median Income. These data are displayed in all the analyses as "Non-DHR Income Eligible: Fee Basis Public Day Care." As mentioned above, the

base run shows available slots in Districts 5, 7, and 10. After non-DHR income eligible demand is served, Districts 5, 7, and 10 have excess supply. Overall, the State has an excess demand of 2356 children. Even though the base run is based on assumed and estimated input data, the base run shows the model is able to accurately portray the different options available in each of the three income eligibility categories.

The Demand and Service Analysis is made on a District and Age Group basis and then totaled at the State level (Appendix G). The children demanding service, children served and children not served are tabulated in each of the following five categories:

1. DHR income eligible children: day care services on a free basis.
2. DHR income eligible children: day care services on a fee basis.
3. Subtotals for DHR income eligible children.
4. Non-DHR income eligible children (but income eligible on a mandatory fee basis in accordance with Title XX of the Federal regulations).
5. Totals of the three income eligible categories.

To compute the number of children in each age group, the Expected Public Child Day Care Usage Distribution - By Age (PCRDYCR - Appendix D-3) is multiplied by the District totals. The base run shows the number of children and their age groups that are served and not served by public day care.

By comparing the demand and children served by age group (Appendix G), the model is able to more accurately

allocate costs. This run shows that 19,621 children could be served statewide on a free basis. There are 295 children that are served on a fee basis. Nevertheless, 1467 DHR income-eligible children were not served on a fee basis due to non-availability of contract public day care spaces in Districts 1, 2, 3, 4, 6, and 8. These variances are caused by excess demand or supply that exists (in the base run) in the Districts. Appendix G portrays the results of the base run for "Non-DHR Income Eligible" and "Totals: DHR/Non-DHR Income Eligible" categories. On a State basis, the table shows DHR could serve an additional 566 non-DHR eligible children on a fee basis if it allowed such children to be served, but would still have 2893 children not served.

Phase 6 - Financial Analysis of Public Child Day Care Services. The model performs a detailed financial analysis for each DHR District (Appendices H and I). Day care costs are estimated by age group for the districts and totaled at the State level. Expected fees the State will receive are calculated. Government costs and family financial participation for public day care are computed. The logic diagram for Phase 6 appears in Figure 2-8.

The average public child day care cost per child is an input variable. This cost for each DHR District was estimated for the base run from the expenditures and usage data published in the Georgia Title XX Comprehensive Annual Services Plan [7, pp. 59-69]. These average costs were prorated

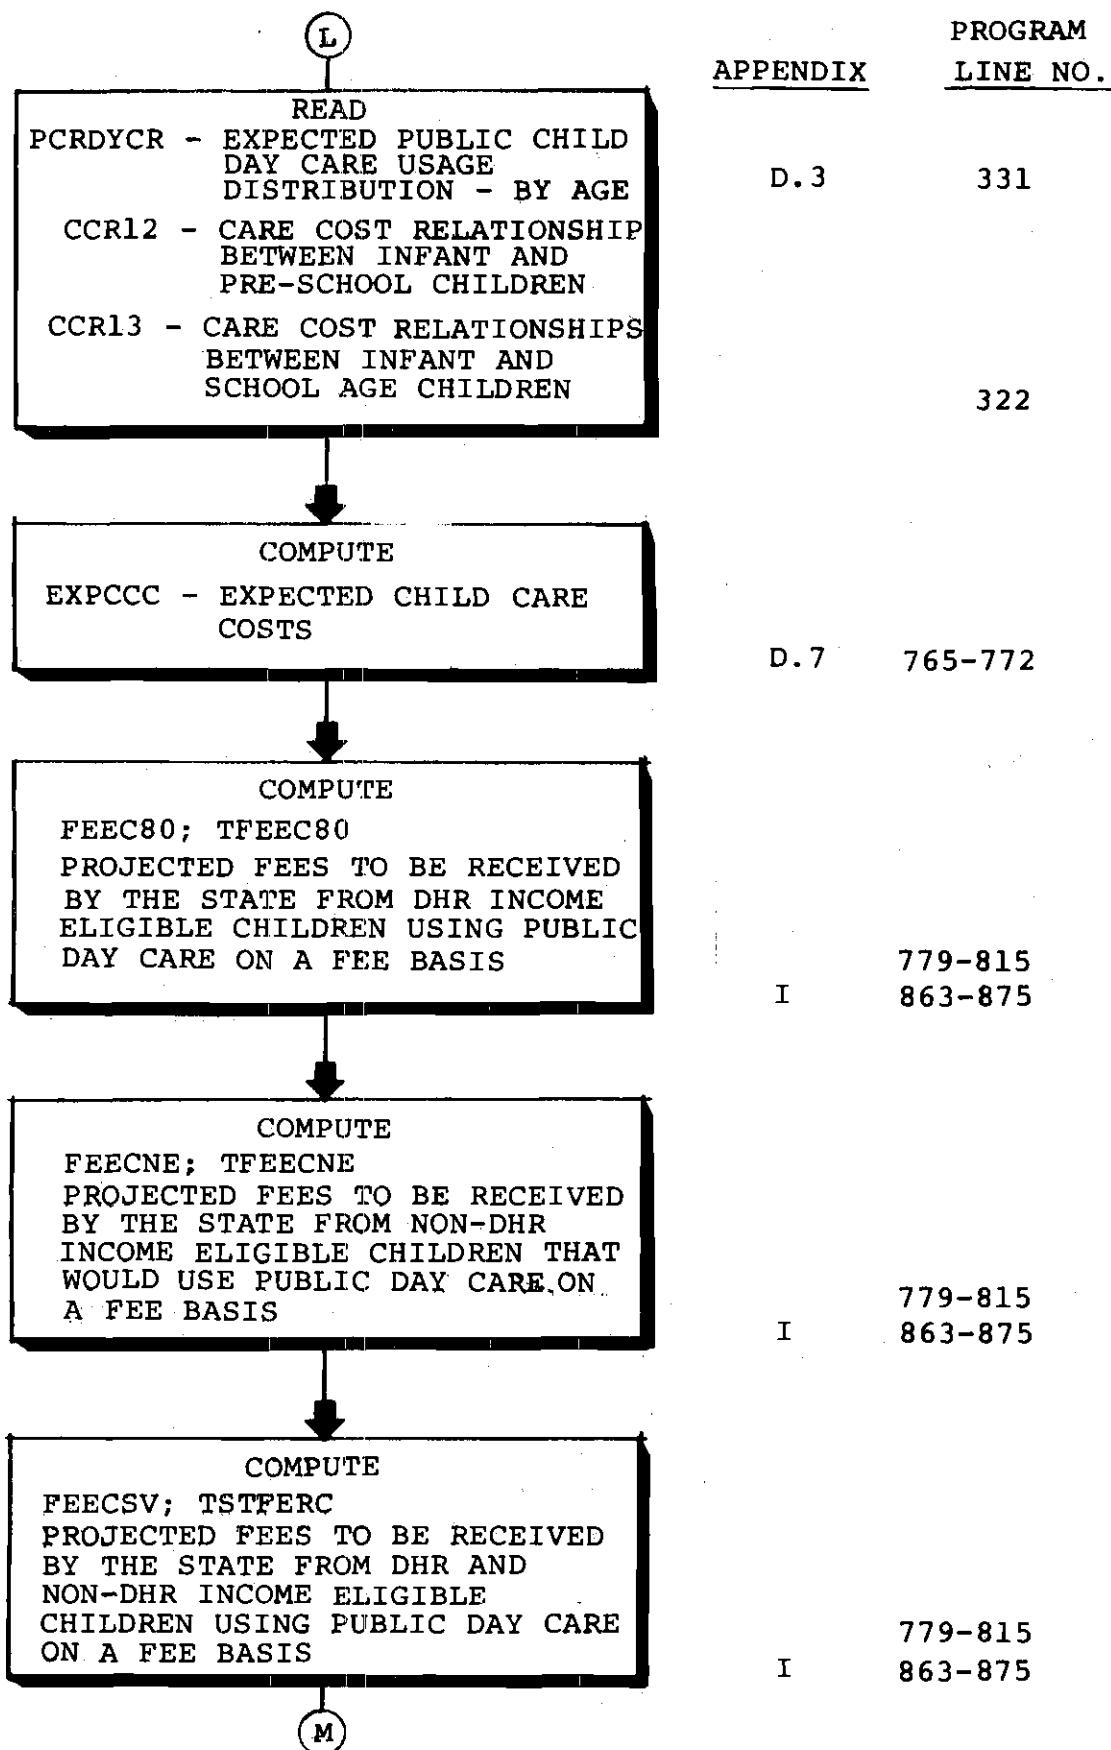

FIGURE 2-8. LOGIC DIAGRAM-PHASE 6

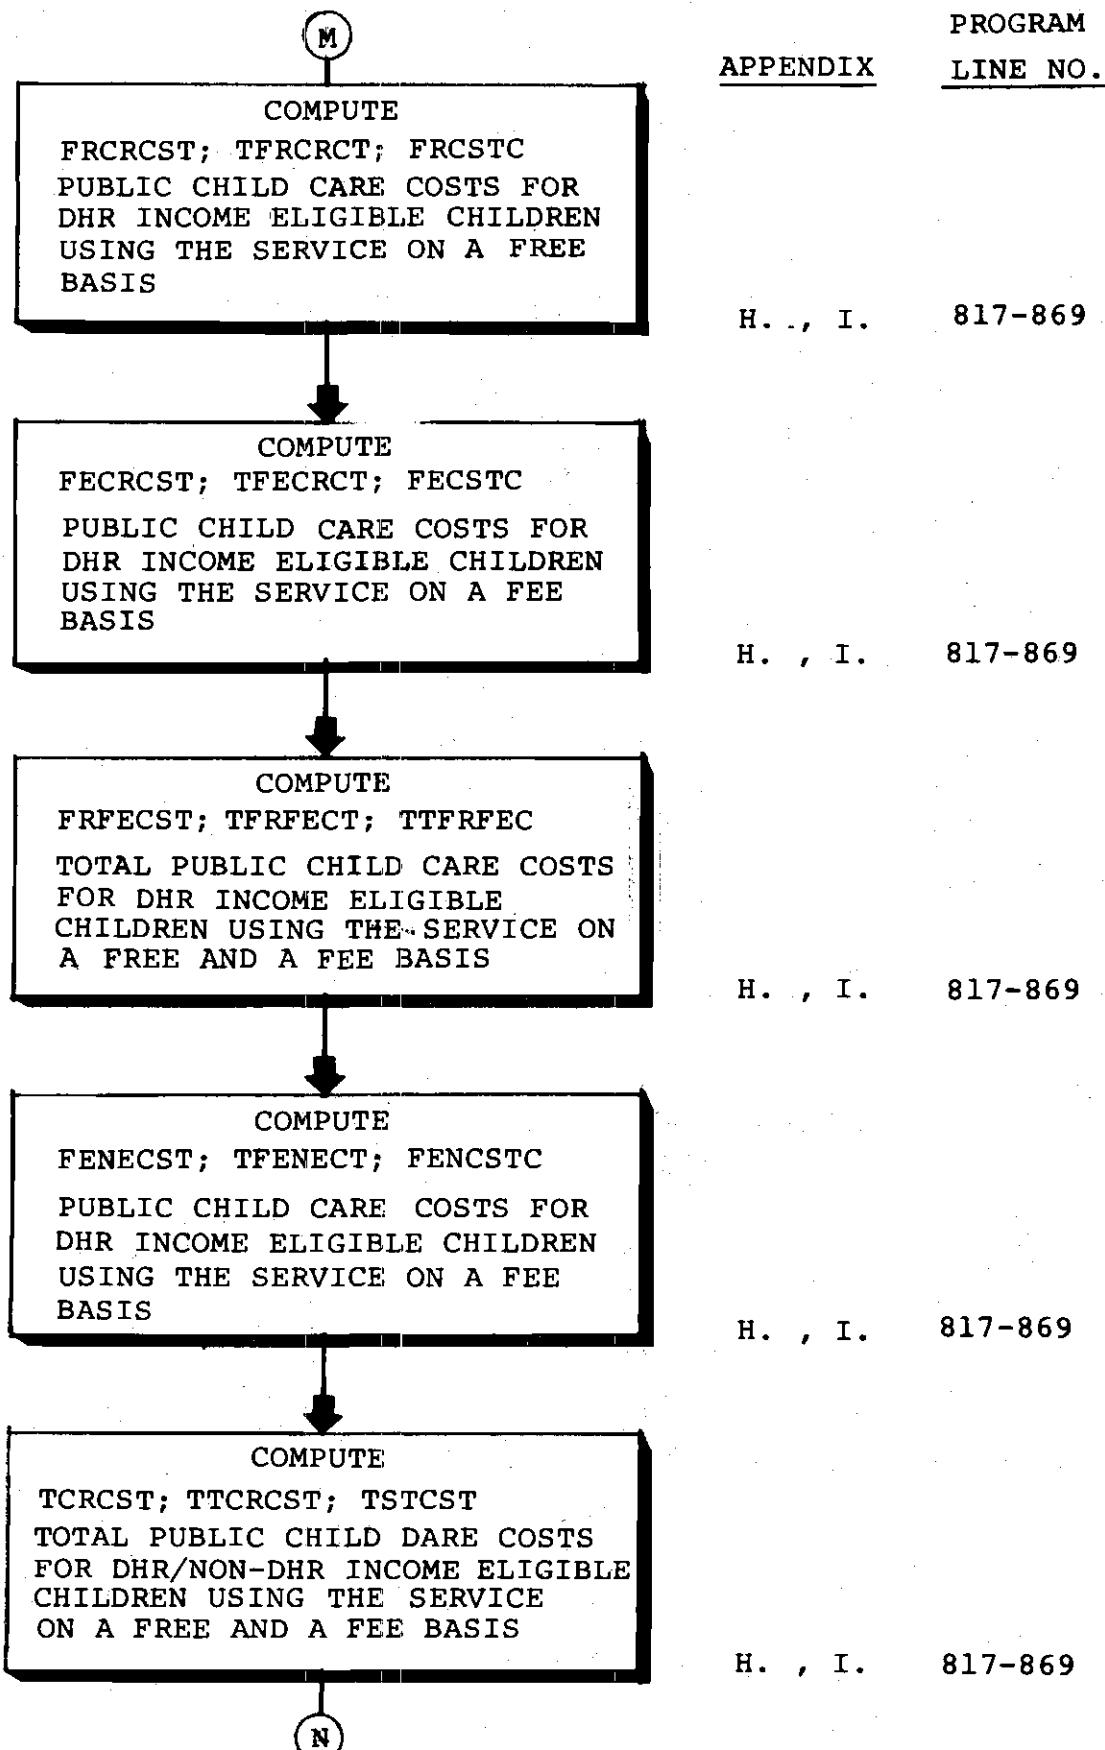

FIGURE 2-8A. LOGIC DIAGRAM-PHASE 6

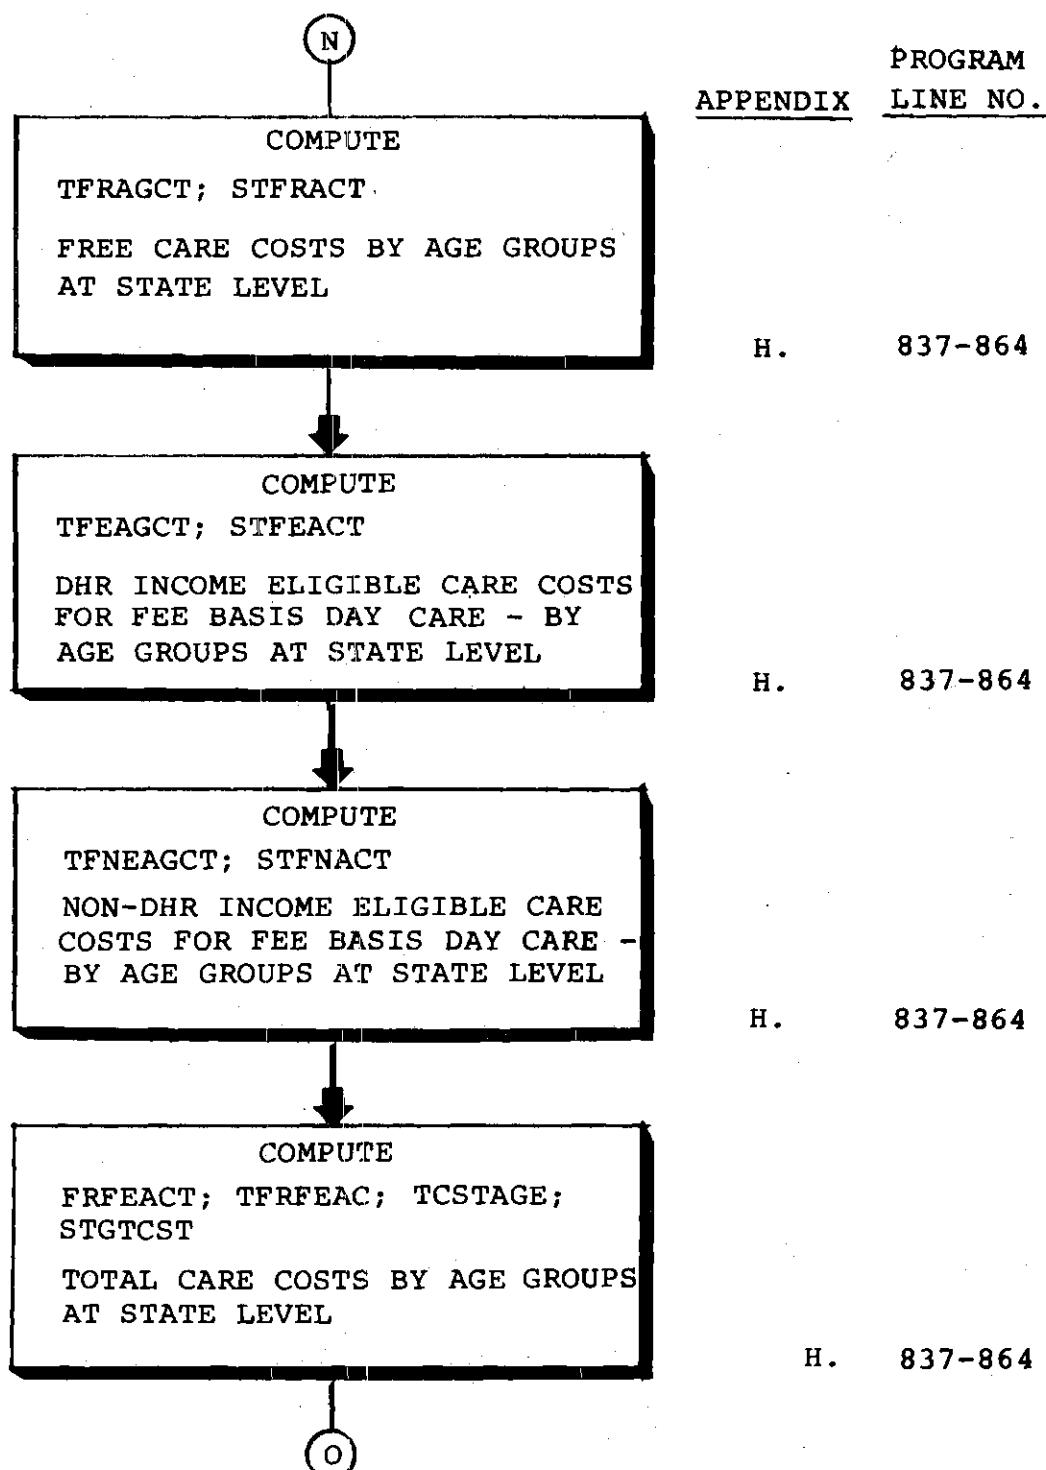

FIGURE 2-8B. LOGIC DIAGRAM-PHASE 6

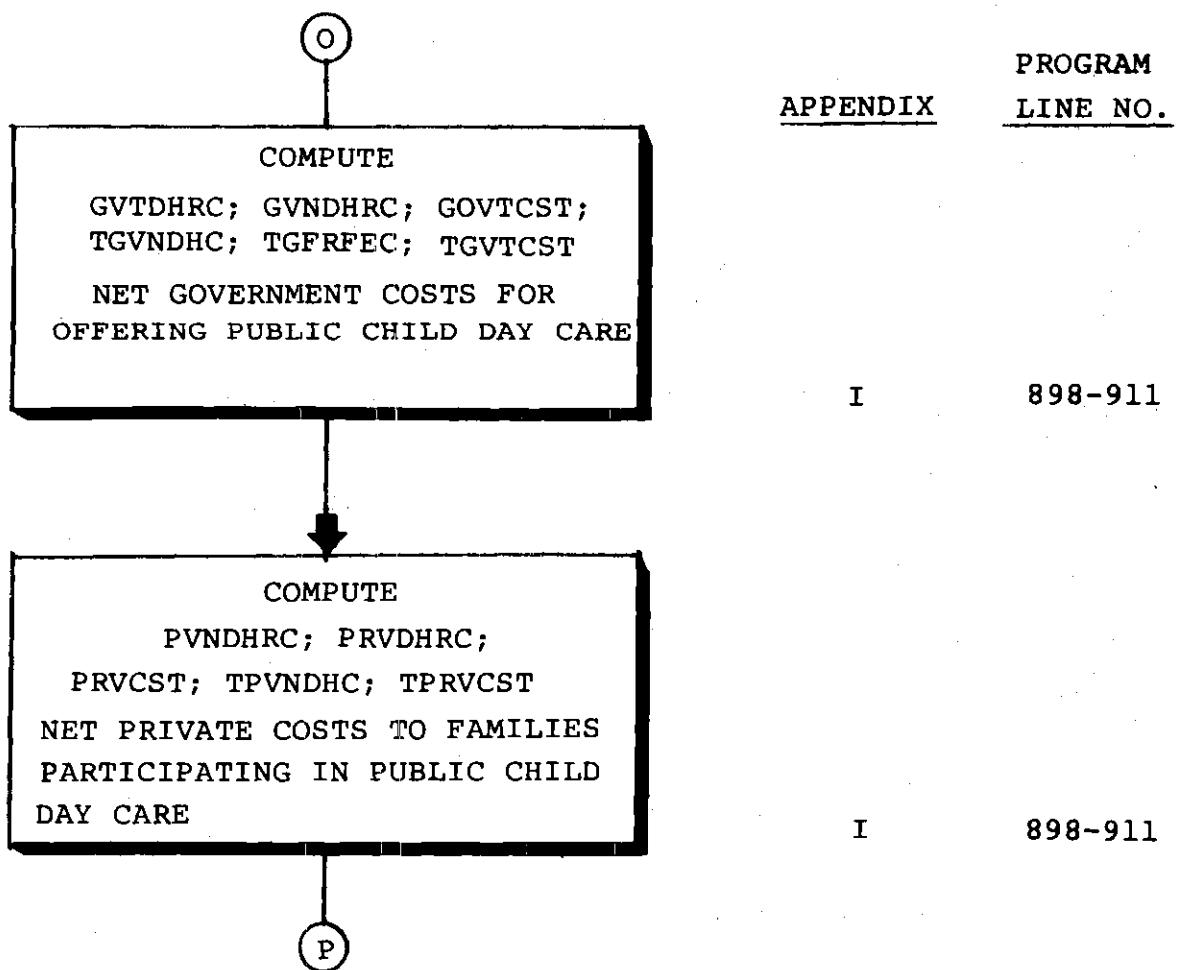

FIGURE 2-8C. LOGIC DIAGRAM-PHASE 6

among the age groups by using the Expected Public Child Day Care Usage Distribution - By Age (Appendix D-3). It is also assumed that care costs are related as follows:

$$\text{AVECOST} = \sum_{i=1}^3 [(\text{PCRDYCR}_i)(\text{EXPCC}_i)]$$

$$\text{EXPCCC}_2 = \frac{\text{EXPCCC}_1}{\text{CCR12}}$$

$$\text{EXPCCC}_3 = \frac{\text{EXPCCC}_1}{\text{CCR13}}$$

where i refers to age category

- i = 1 - infants (less than 3 years old)
- i = 2 - preschool (4 - 6 years old)
- i = 3 - school age (7 - 14 years old)

and

PCRDYCR_i is the Expected Public Child Day Care Usage Distribution - By Age

EXPCCC_i is the Expected Child Care Cost

CCR12 is the Care Cost Relationship between Infant and Pre-School Children ($\text{CCR12} = 1.5$ in the base run)

CCR13 is the Care Cost Relationship between Infant and School-Age Children ($\text{CCR13} = 2.0$ in the base run)

AVECOST is the Average Cost of public child day care for a particular district

The Financial Analysis for Public Day Care (Appendix H)

shows the expected care costs for each District and Age Group together with the number of children served. These computations are performed for each of the three income eligibility categories. The base run shows the cost to provide free day care ranges from \$429,698 in rural District 4 to \$11,038,657 in urban District 3 (Atlanta area). It also shows the costs for providing day care services on a fee basis for DHR and non-DHR eligible children.

The Summary of Financial Analysis is made at District and State levels (Appendix I). Projected fees to be received by each DHR District are calculated from the Sliding Fee Schedule and public day care usage, i.e., the number of children served on a fee basis. The Summary shows child care costs, projected fees, and the financial participation between public and private sources.

The base run shows how the sliding fee system helps to reduce government costs of day care. It particularly points out that if DHR desires to offer public day care for non-DHR eligible children, over 90 percent of costs would be covered by fees received.

Phase 7 - Simulation of the Public Child Day Care Model Through Time. The model adjusts two variables as time advances into the next period. The logic diagram for Phase 7 appears in Figure 2-9. In each DHR District, supply increases (decreases) by a fixed percentage of the excess demand (excess supply) in that district during the previous year.

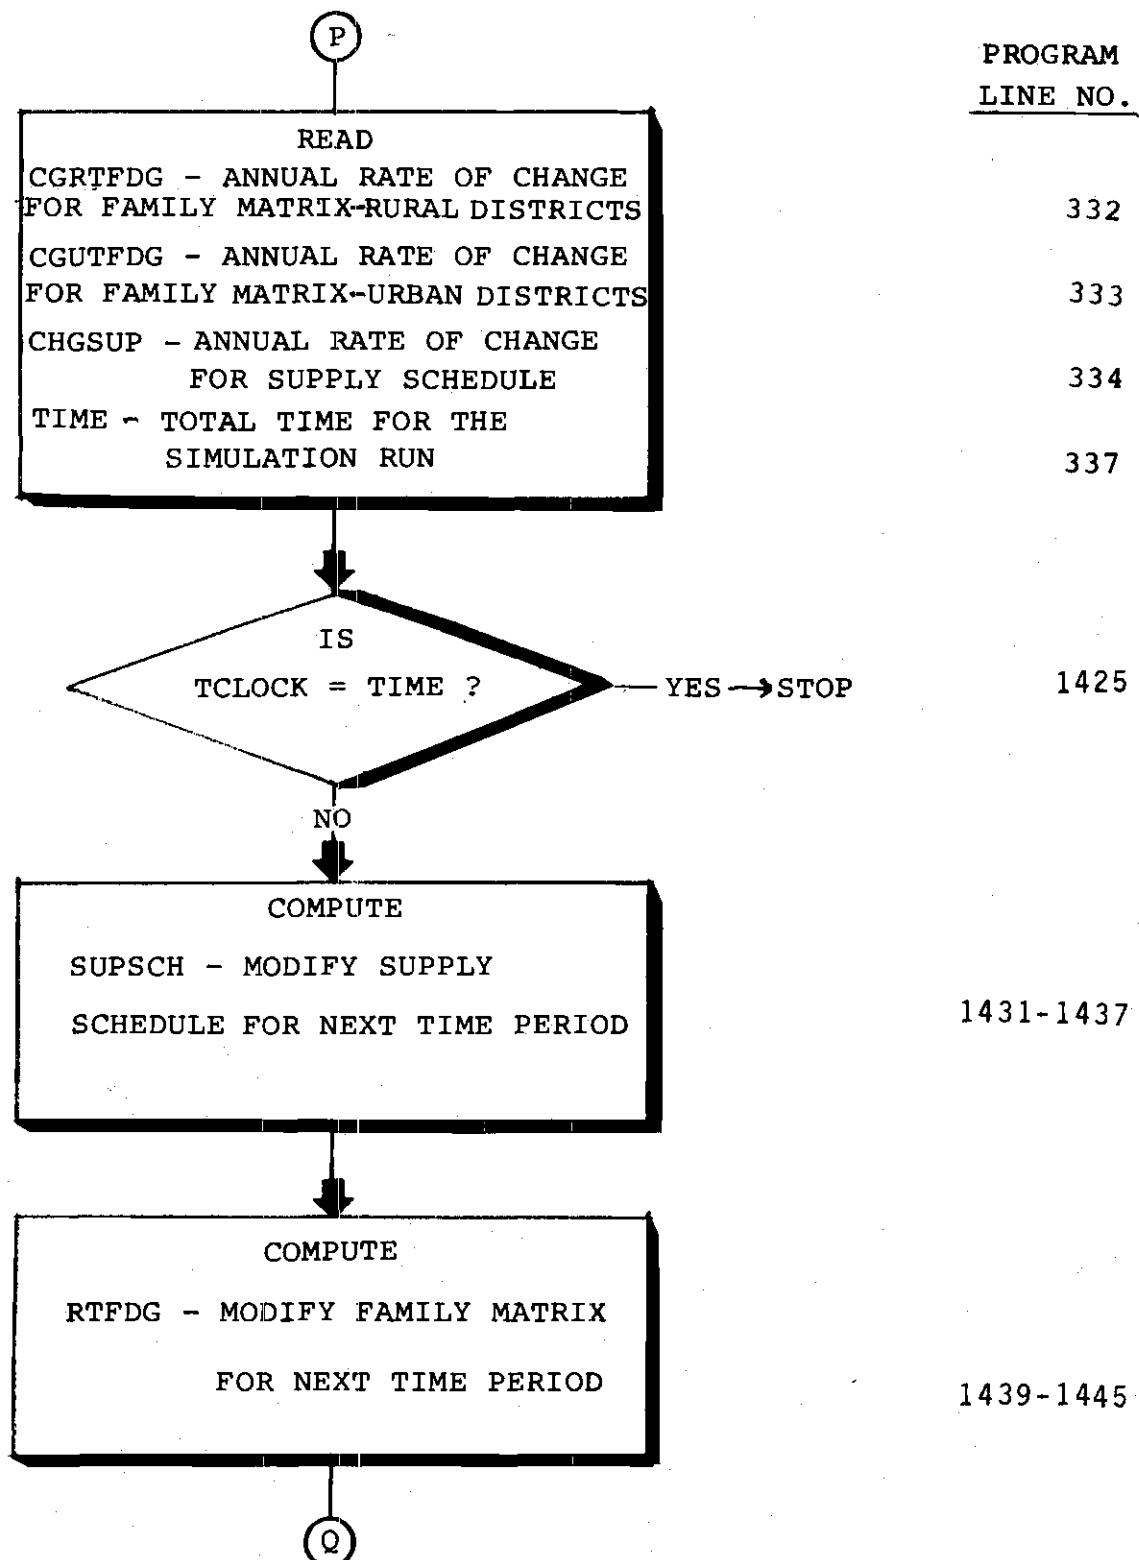

FIGURE 2-9. LOGIC DIAGRAM-PHASE 7

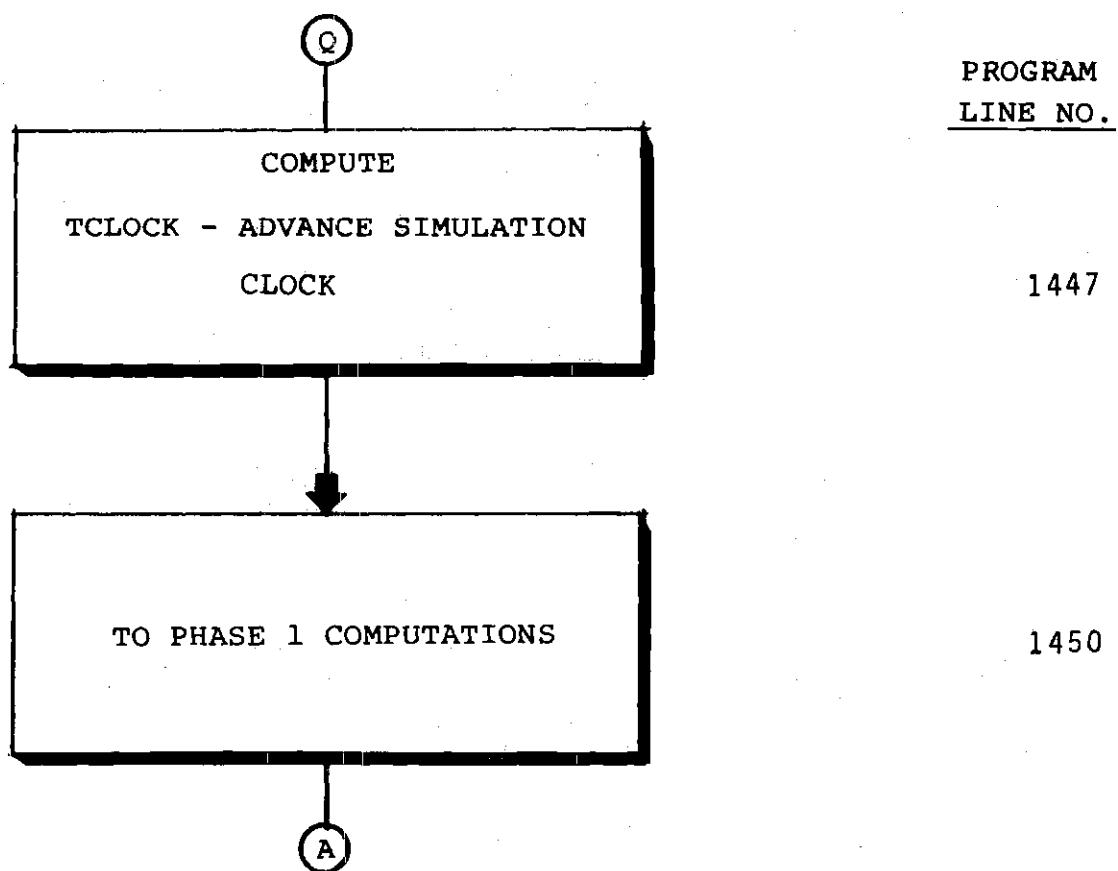

FIGURE 2-9A. LOGIC DIAGRAM-PHASE 7

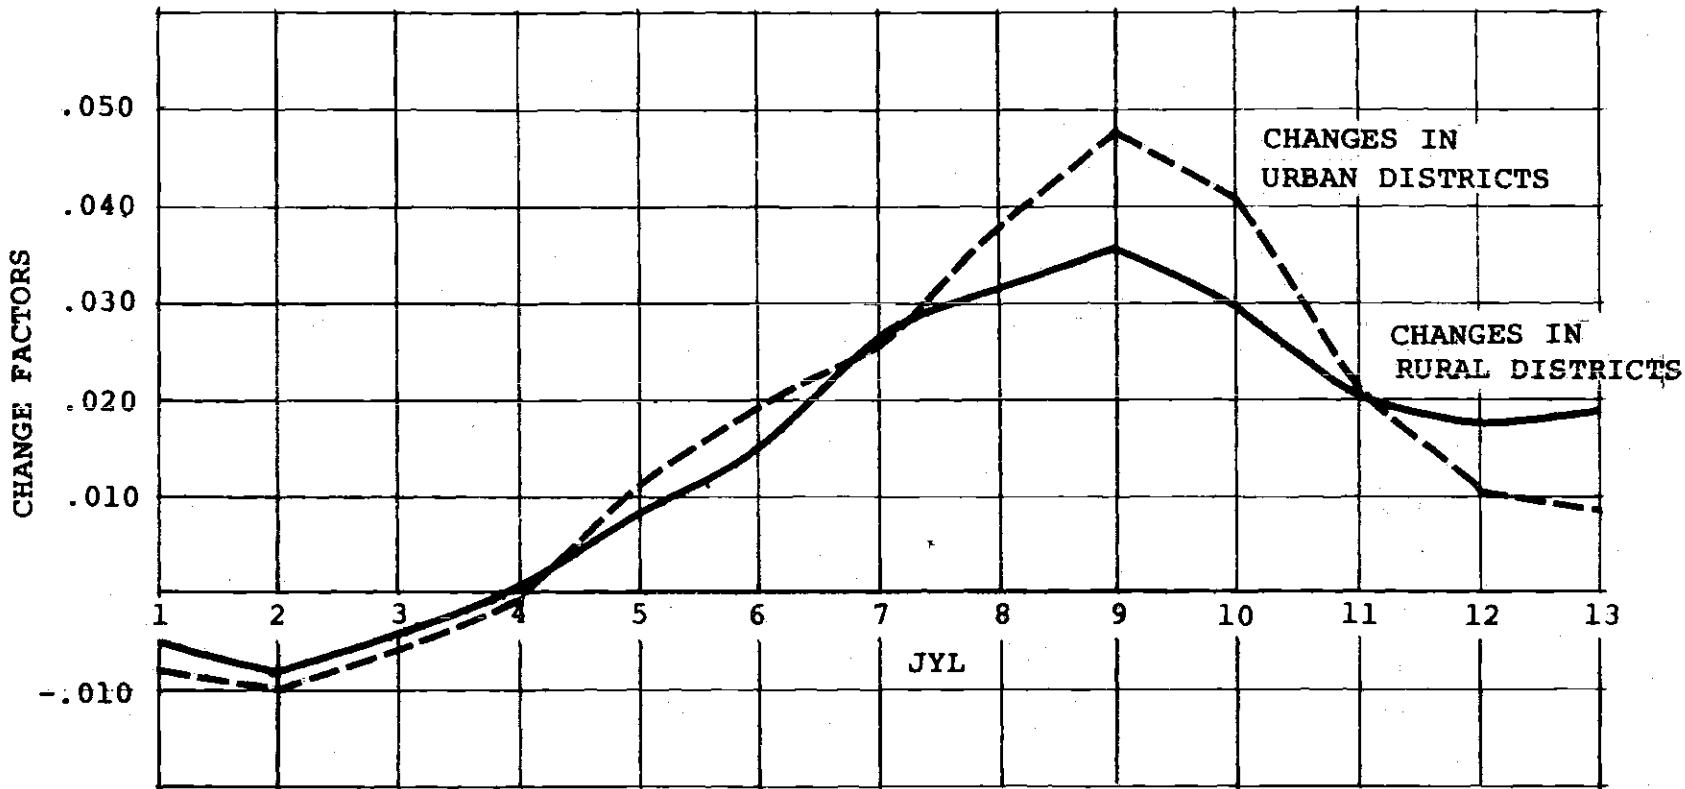

The base run adjusts supply in accordance with the following factors:

Rate of Change in Supply Schedule

<u>DHR Districts</u>	<u>Rate</u>
1	.050
2	.050
3	.112
4	.090
5	.060
6	.040
7	.050
8	.080
9	.070
10	.040

For example, District 3 had a total excess demand of 4158 at the end of time period 1 (year one) (Appendix F). Phase 7 would increase the present supply of 8804 to 9269 slots, i.e., by 11.2 percent of excess demand for time period 2. On the other hand, District 10 had an excess supply of 224 slots. Phase 7 would decrease the District supply from 1081 to 1071 slots, i.e., by 6 percent of excess supply for the second year.

Changes in the family matrix (TFDG) are assumed to be different in urban versus rural districts. Rate of change in the family matrix is applied to each matrix cell which is categorized by district, by family income, and by family size. The base run assumes the rates of change for the different family sizes and types of district as shown in Figure 2-10.

FAMILY INCOME LEVELS

JYL	1	2	3	4	5	6	7	8	9	10	11	12	13

FIGURE 2-10. ANNUAL RATE OF CHANGE IN FAMILY MATRIX

The effect of the family matrix change factors is observed by comparing Appendices D-4, and J which show time periods 1 and 5, respectively.

After time period 1, the model re-computes the basic family matrix (TFDG) and the Families with Children under 14 Years (FWCUF) matrix. Computational Phase 2 and parts of Phases 3 and 4 are skipped, as the income parameters, demand schedule and income eligibility criteria are assumed to be valid for the entire run. The model performs revised demand, supply, service and financial analyses for all the remaining time periods.

2.3 Model Assumptions

The following are simplifying assumptions of the model, listed by phase:

2.3.1 Phase 1

1. Differences in family composition distributions are significant between urban and rural districts, but not among the various rural districts.
2. The national distribution of families with children under 14 years of age is assumed to be valid in Georgia.
3. For families with children under 14 years old, a family size of two members consists of one adult and one child. Family sizes of three to ten members consist of two adults and the remainder are children under 14.

2.3.2 Phase 2

1. The seven income parameters as discussed in section 2.2.2 are the most significant factors in determining net real family income.

2. The estimated and assumed data are consistent in terms of their relationships with family size and family income, and are "realistic" for model testing purposes.

3. The Sliding Fee Schedule is a function of the annual average public child day care cost per child for each DHR district.

4. The maximum fee to be levied is the annual average public child day care cost per child for each DHR district.

2.3.3 Phase 3

1. Demand for public day care is a function of expected fees for day care as related to the real net family income. Demand varies inversely with the independent variable (i.e., the ratio of Expected Public Child Day Care Fees per Family to Real Net Family Income).

2. The demand function is assumed to consist of two negatively-sloped, intersecting straight lines.

2.3.4 Phase 4

1. The use of rounded-down income levels to determine family eligibility does not cause significant errors with respect to the exact income cut-off points of 61, 80 and 115 percent of the adjusted State median income.

2. The demand function primarily applies to rural

districts in the State. An Urban Density Demand Correction factor is assumed to be valid to adjust the demand schedule for urban demand characteristics.

2.3.5 Phase 5

1. The public day care service priorities are realistic criteria to assign the available spaces, as discussed in section 2.1.

2. The national sample of Expected Public Day Care Usage Distribution - By Age (Appendix D-3) is valid throughout the State. This usage distribution is valid to allocate, by age, children demanding service, children served and children not served by public child day care.

3. The model assumes only full-day usage of day care services. Part-time day care users are not identified by the model.

2.3.6 Phase 6

1. The estimated average cost per child for each DHR district is assumed to be the basis for computing cost by age group.

2. Public child day care cost allocation by age group usage is valid to determine actual care costs for each DHR district.

3. The care cost relationships between infant and pre-school children (CCR12) and between infant and school-age children (CCR13) depict a realistic cost relationship. Care cost is assumed greater for infants than for pre-school

children and greater for pre-school than for school-age children. The age group categories are:

- (a) Infants - children up to 3 years old
- (b) Pre-School - children between 4 and 6 years old
- (c) School-Age - children between 7 and 14 years old

4. The estimated fees to be charged by each DHR district accurately represent the actual fees paid to the State by participating families.

2.3.7 Phase 7

1. The model assumes two factors to change over time and thereby to affect the demand for public day care services: supply schedule and families in each income level.

2. Incremental changes in available day care spaces are a function of excess demand or excess supply in each DHR district. Supply changes annually (increase/decrease) by a fixed percent of excess demand or supply.

3. Changes in the family matrix (i.e., income levels) are assumed to be different in urban versus rural districts, but not significantly different among the rural districts.

4. The net percentage change in the number of families within the cells of the family distribution matrix is the same for all family sizes at a given income level. The percentages vary, however, across income levels.

2.4 Model Flexibility and Advantages

The model was developed to facilitate changes in parameters. The demographic data that can be changed are:

1. Total families (by income levels and districts) at the start of the run (TFYD)
2. Family composition in rural and urban districts (FCYMDR, FCYMDU)
3. Distribution of families with children under 14 years (PFCUF)
3. "Child family factor" or number of children assumed for a given family size (CFF)

The demand schedule can be modified by changing the three input points defining the linear system:

1. DSUP - upper point
2. DSMP - middle point or point of intersection
3. DSLP - lower point

The urban density demand correction factor (UDDDCF) can be changed in order to adjust the demand relationship in urban areas.

The supply schedule (SUPSCH) is also an input which defines the initial number of contracted spaces for public day care usage.

The economic parameters can be changed to reflect updated figures as changes in taxes and economic aid to families occur. These parameters are as follows:

1. Tax liability (TAXLIA)
2. FICA withholding (FICA)
3. Expected public child day care fees (EXPCCC)
4. Medicare benefits (MDCARE)
5. Public housing benefits (PUBHSG)
6. Aid to families with dependent children benefits (AFDC)
7. Food stamp benefits (FDSTMM)

The public day care benefits and costs can also be easily modified to show changes in Federal and State policies and regulations as well as updated data. The variables affected

are:

1. Family eligibility cut-off points (PCMDIN)
2. Factors for adjusting family income to family size (ADJINC)
3. Median income (MEDINC)
4. Average cost of public day care per child per DHR District (AVECOST)
5. Expected public child day care usage distribution: by age (PCRYMDR)

The simulation phase of the model also offers flexibility as the user can alter the following:

1. Length of simulation run (TIME)
2. Factors by which supply changes from period to period (CHGSUP)
3. Factors by which the family distribution matrices change in urban and rural districts (CGUTFDG, CGRTFDG)

The model calculates non-DHR income eligible children on the following basis if day care services were offered in this income category:

1. Children who would demand service
2. Children who would use day care
3. Children who would not be served due to lack of contracted space

The financial analysis shows the government costs and fees that would be received. With the flexibility of changing cut-off points, modifying the fee schedule and child care costs, DHR can use this model as a management planning tool to evaluate changes in their present interim public child day care service.

CHAPTER III

SENSITIVITY ANALYSIS

Sensitivity analyses were performed with respect to five major factors in the model. In each of five computer runs, one factor was changed while all other factors retained the values assigned in the base run. The sensitivity runs test the behavior of the model with respect to the following five factors:

1. the coordinates of the demand schedule (DSUP, DSMP, DSLP)
2. the fees-to-cost ratios (FECSTR); that is, the sliding fee schedule
3. the average public child day care cost per child per District (AVECOST)
4. the annual rate of change in the family matrix (CGRTFDG and CGUTFDG)
5. the annual rate of change in the supply schedule (CHGSUP).

Each cell value of these variables was increased by 25 percent.

3.1 Demand Schedule

In this sensitivity run, the coordinates of the demand function were increased by 25 percent as follows:

	<u>Base Run</u>	<u>Sensitivity Run</u>
DSUP	(.000, .092)	(.000, .115)
DSMP	(.049, .060)	(.061, .075)
DSLP	(.300, .000)	(.375, .000)

Both the original and the new demand functions are graphically portrayed in Figure 3-1. The graph shows that the demand function of the sensitivity run significantly increases the percent of families demanding service with larger fees-to-real net income ratios. Hence, a greater number of families would be expected to demand public day care service, especially in the fee-basis categories.

Appendices K-1 to K-7 show the results of the sensitivity run for year 1. The effect of the 25 percent increase in the demand function coordinates is summarized in Table 3-1. This table shows that demand for free-basis public day care increased in a narrow range of 25 to 29 percent. On the other hand, DHR income eligible demand for service on a fee basis increased in a range of 40 to 110 percent. Also, children not income eligible in Georgia, but demanding fee-basis day care increased in a range of 38 to 138 percent. On a state-wide basis, increases in total demand for all three income eligibility categories were between 29 and 41 percent. The run results show the model is sensitive to changes in the demand function for children whose family income is greater than 61 percent of the adjusted State median income (Appendices K-2, K-3, K-4). The children in this income range comprise about 18-24 percent of the total demand for public child day care in the State.

Due to the increased demand for DHR income eligible children, the available supply in districts one through nine

are fully utilized (Appendices K-4, K-5). District 10 has available 90 spaces for children that demand day care service on a fee basis but are not income-eligible in Georgia (Appendix K-4).

3.2 Sliding Fee Schedule

The fees-to-cost ratios (FECSTR - Appendix L-1) were increased by a factor of 25 percent. The increase is reflected in the Sliding Fee Schedule (FEESCH - Appendix L-2). The fee to be charged for each income and family size category is closer to the maximum allowable fees, i.e., approximates the average public day care cost for that DHR District. Families eligible for public day care expect to pay higher fees (Appendix L-3) for these services. The expected higher fees should cause four factors to change:

1. Real Net Income decreases (Appendix L-4) because expected fees are subtracted from gross income.
2. Expected Fees-to-Real-Net-Income ratios increase (Appendix L-5).
3. Percents of Families Demanding Service decrease (Appendix L-6).
4. Number of eligible children demanding and using public day care on a fee basis decrease (Appendix L-7).

Table 3-2 summarizes the results on demand when the fee schedule is increased by 25 percent. No change in demand occurs for income eligible children demanding public day care on a free basis. The DHR income eligible children demanding public day care on a fee basis decreases in a range of 7 to

7	1,466	1,410	-56	-4
8	2,293	2,256	-37	-2
9	2,401	2,290	-111	-5
10	823	788	-35	-4
STATE TOTALS	28,342	27,293	-1,049	-4

to 44 percent over the ten districts. The net decrease in demand for all DHR income eligible children is about one or two percent. In the Non-DHR income eligible category, demand decreases between 7 and 27 percent. Overall public day care demand decreases from two to five percent. Hence, the sensitivity run indicates that demand varies inversely with day care fees for fee-basis categories.

The Summary of Financial Analysis shows that the decrease in demand also decreased fees received for both fee-basis day care categories (Appendix L-10). The number of children actually served on a fee basis is also adversely affected by the increase in fees as follows:

Children Served on a Fee Basis

DHR Districts	DHR Income Eligible		Non-DHR Eligible	
	Base Run	Sensitivity Run	Base Run	Sensitivity Run
1	0	0	0	0
2	0	0	0	0
3	0	0	0	0
4	0	0	0	0
5	134	94	274	217
6	0	0	0	0
7	106	85	219	184
8	0	0	0	0
9	10	10	0	0
10	45	29	73	54
State Totals	285	218	566	455

3.3 Day Care Costs

Day care costs for each DHR District were increased by 25 percent as follows:

Average Public Child Day Care Costs

<u>DHR District</u>	<u>Base Run</u>	<u>Sensitivity Run</u>
1	\$ 783	\$ 979
2	924	1155
3	1254	1568
4	448	560
5	843	1054
6	663	829
7	701	876
8	457	571
9	876	1095
10	994	1243

This change should cause shifts in model behavior similar to those caused by increasing the sliding fee schedule.

The sensitivity run results are shown in Appendix M. Table 3-3 summarizes the effect of increased costs on demand. Demand for free-basis day care is not affected by changes in public day care costs. On the other hand, the sliding fee schedule reflects the costs for public day care in each DHR District (Appendix M-1). Higher fees affect the following factors:

1. Expected Day Care Fees increase (Appendix M-3).
2. Real Net Family Incomes decrease (Appendix M-4).
3. Expected Fees-to-Real-Net-Income ratios increase (Appendix M-5).
4. Percent of families demanding day care on a fee basis decreases (Appendix M-6).
5. Number of children demanding and using day care on a fee basis decreases (Appendix M-7).

Changes in demand are summarized in Table 3-3. Cost

increases do not affect demand for free public day care. Demand for DHR income eligible children for fee-basis day care decreases in a range of 7 to 48 percent. The Non-DHR Income Eligible category shows a decrease in demand in a range of 11 to 52 percent.

The Summary of Financial Analysis reflects the increased day care costs for all public day care categories (Appendix M-10). It also shows a decrease in fees received as a result of a drop in children served on a fee basis.

3.4 Annual Rate of Change in Family Matrix

The annual rate of change in family matrix was also increased by 25 percent for both urban and rural districts (Appendix N). These ratios are as follows:

Income Categories (JYL Index)	Districts	
	Urban	Rural
1. Base Run		
1	-.006	-.009
2	-.009	-.010
3	-.004	-.006
4	-.002	-.003
5	.008	.011
6	.014	.019
7	.026	.025
8	.032	.039
9	.036	.048
10	.030	.041
11	.027	.021
12	.018	.011
13	.019	.009
2. Sensitivity Run

2	-.011	-.013
3	-.005	-.008
4	-.003	-.004

<u>Income Categories (continued)</u>	<u>Districts</u>	
	<u>Urban</u>	<u>Rural</u>
5	.010	.014
6	.018	.024
7	.033	.031
8	.040	.049
9	.045	.060
10	.038	.051
11	.034	.026
12	.023	.014
13	.029	.011

Table 3-4 (Time Period 2) and Table 3-5 (Time Period 5) show that demand is not highly sensitive to the rate of change in the family matrix. In Time Period 2, many districts experienced a relatively insignificant increase in demand for public day care as compared with the base run. Time period 5 reflects about 2 percent increase in demand over the base run demand for the same year. Hence, normal trends in the socio-economic characteristics of the population should not significantly impact the model.

3.5 Annual Rate of Change in Supply Schedule Sensitivity Analyses Run Results (Time Periods 2 and 5)

The annual rate of change in the supply schedule is increased by a factor of 25 percent for the sensitivity analysis. The rates of change used for both runs are:

<u>DHR Districts</u>	<u>Base Run</u>	<u>Sensitivity Run</u>
1	.050	.063
2	.050	.063
3	.112	.140
4	.090	.113
5	.060	.075
6	.040	.050

10	.040	.050

The sensitivity analysis run results are shown in Appendices O-1 to O-4. Tables 3-6 (Year 2) and 3-7 (Year 5) compare the number of children served in the base run and sensitivity analysis run. The comparison shows on a district-by-district basis where the available day care spaces are allocated by the model. Since the number of day care slots to be allocated in the following time period is a function of excess demand and excess supply, the model increases or decreases available supply accordingly for each district. Table 3-8 summarizes the children served on a State basis by day care service category and time period. The overall demand for free-basis day care precludes a significant use of additional spaces for children on a fee basis. Figure 3-2 shows how excess demand is significantly decreased by the faster rate of growth in the supply schedule. Since the additional spaces are filled by free-basis care children, the fees received by the State are insignificant to the increased care costs (Appendix O-4).

FIGURE 3- 2 . EXCESS DEMAND

CHAPTER IV

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

4.1 Summary

A simulation model has been developed to assist the Georgia Department of Human Resources in the economic evaluation of alternative fee schedules and administrative policies for Title XX child day care services. The inputs to the model can be changed easily in terms of fee scale parameters, economic and demographic assumptions, and administrative regulations. The model's computational mechanism provides the user:

1. Demand, supply and usage analyses
2. Financial analysis of costs incurred and fees received for public child day care
3. Economic impact on real net family income for participating families; that is, the notch effects are identified.

All analyses are performed on a district-by-district basis with State totals.

The model takes into account the dynamic nature of the problem. At the end of each time period (year), the model updates the family distribution matrix and the supply schedule. The supply schedule is adjusted upward (or downward) as a fixed percent of excess demand (or excess supply) in each DHR District.

The model is divided into seven computational phases.

Flexibility is provided with respect to the length of model runs and the suppression of various portions of output.

The focus of this Thesis has been the development of the computational mechanism required to perform evaluations of sliding fee schedules. Some of the data that are needed to operate the model are yet to be developed by DHR. With respect to these types of data, the model has been tested using assumed, but realistic values. Sensitivity tests show that the model behaves as expected with alterations in key parameters.

4.2 Conclusions

The model's behavior was tested for sensitivity to five major factors. The sensitivity run results yield the following insights:

1. Increasing the coordinates of the demand function by 25 percent significantly increased the percent of families demanding service. Although demand for public day care increased between 25 to 29 percent, demand for fee-basis care increased in a range from 40 to 110 percent. Hence, the demand function is highly sensitive for families whose income is greater than 61 percent of the adjusted State median income.
2. A 25-percent increase in fees resulted in a decrease in demand for fee-basis day care. The drop in demand was in a range of 7 to 44 percent for families whose income was between 61 and 80 percent of the adjusted

State median income. The number of children served on a fee basis also decreased significantly.

3. The annual average cost per child for public day care was increased by 25 percent in each of the ten districts. As expected, no change in demand for free day care occurred. Since the sliding fee schedule reflects cost in each district, the increased fees resulted in a significant decrease in demand and usage of public day care on a fee basis in a range of 7 to 48 percent.

4. A 25-percent increase in the annual rate of change in the cell values of the family matrix caused a relatively insignificant increase in demand for public day care as compared with the base run.

5. The annual rate of change in the supply schedule was increased by 25 percent. An increase in available public day care spaces was absorbed primarily by the demand for free-basis day care. Hence, public day care usage on a free-basis precludes a significant use of additional spaces on a fee basis.

4.3 Recommendations

The accuracy and behavior of the model can be refined to better serve the user. The model can be improved in the following ways:

1. Provide updated and accurate input data in terms of:

- a. demographic composition and distribution
 - b. income parameters
 - c. cost data to reflect actual public child day care costs
 - d. data expressed in dollars should be adjusted to a current or a constant dollar basis to reflect consistent relationships
 - e. demand and supply functions
 - f. annual rate of change in supply and families could be adjusted by different methods as suggested in the test.
2. Incorporate into the model less than full-day usage of public day care.
 3. Perform demand, supply, usage and financial analyses at a more detailed level, such as county, city or other smaller geographical (political) areas.
 4. Modify the sliding fee schedule to reflect smaller fee and income level increments.
 5. Modify the family matrix to reflect the increased number of income levels as suggested in #4.
 6. Use the exact cut-off points of 61, 80, and 115 percent of the adjusted State median income rather than rounded values to determine income eligibility for public child day care services.
 7. Adapt the methodology developed in this model to other governmental jurisdictions, i.e., other states, regions, or the nation as a whole. Modifications in the model would be required to reflect different policies, regulations, administrative mechanisms, other major influencing factors and the nature of the environment.

TFYD (IDD, JYL)	Total Families in the State: by District and Family Income Level

Phase 2

<u>Variable</u>	<u>Definition</u>
AFDC(JYL,KFM)	Aid to Families with Dependent Children - Benefits (\$/family/year)
AVEINC(JYL)	Average Family Income per Income Level (\$/year)
AVECOST(IDD)	Public Child Day Care Cost per Child per District (\$/year)
CCR12	Care Cost relationship between Infant and Pre-School Age Child
CCR13	Care Cost relationship between Infant and School-Age Child
EXPCCC(IDD,LAG)	Expected Public Child Care Costs (\$/year/child) by District and Age Group
EXPFEF(IDD,JYL,KFM)	Expected Public Child Care Fees for a Family (\$/year/family)
FDSTM(M,K,J)	Federal Food Stamp Benefits (\$/family/year)
FDSTMPL(JYL,KFM)	Federal Food Stamp Benefits (\$/family/year)
FECSTR(JYL,KFM)	Fees as a Proportion of Care Costs (fraction)
FEESCH(IDD,JYL,KFM)	Sliding Public Day Care Fee Schedule (\$/child/year)
FICA(JYL,KFM)	Fica Withholding (\$/family/year)
MDCARE(JYL,KFM)	Medicare Benefits (\$/family/year)
MXFECD(IDD)	Maximum Public Child Care Fee - Average Care Cost per Child for Each District (\$/child/year)
PUBHSG(JYL,KFM)	Public Housing Benefits (\$/family/year)
RNY(IDD,JYL,KFM)	Real Net Income for a Family (\$/year)

TAXLIA (JYL, KFM) Federal Income Tax Liability (\$/
family/year)

Phase 3

<u>Variable</u>	<u>Definition</u>
DSL P(N)	Demand Schedule - lower points (fraction)
DSMP(N)	Demand Schedule - middle points (fraction)
DSUP(N)	Demand Schedule - upper points (fraction)
FCUFDS (IDD, JYL, KFM)	Families with Children under 14 Years Demanding Public Child Care Services
FETORY (IDD, JYL, KFM)	Fee-to-Real Net Income Ratio (fraction)
PFDS (IDD, JYL, KFM)	Percent of Families Demanding Service
SLP(1)	Slope of Straight Line #1
SLP(2)	Slope of Straight Line #2
YINTR1	Y-Intercept Straight Line #1 (fraction)
YINTR2	Y-Intercept Straight Line #2 (fraction)
XINTR2	X-Intercept Straight Line #2 (fraction)

Phase 4

<u>Variable</u>	<u>Definition</u>
ADJINC (KFM)	Adjusting State Median Income Factor for Family Size
	DHR Eligible Children Demanding Free Public Day Care
CF61D (IDD)	By District
CF61DY (IDD, JYL)	By District, by Family Income
CF61YF (IDD, JYL, KFM)	By District, by Family Income and Size

	DHR Eligible Children Demanding Public Day Care on a Fee Basis
CF80D(IDD)	By District
CF80DY(IDD,JYL)	By District, by Family Income
CF80YF(IDD,JYL,KFM)	By District, by Family Income and Size
	Non-DHR Eligible Children Demanding Public Day Care on a Fee Basis
CL15D(IDD)	By District
CL15DY(IDD,JYL)	By District, by Family Income
CL15YF(IDD,JYL,KFM)	By District, by Family Income and Size
FAMELG(KFM,MYD)	Family DHR-Income Eligibility Reference Table (\$/family/year)
FR61YF(IDD,JYL,KFM)	DHR Income Eligible Families Demanding Free Public Day Care (family income < 61% State median income)
FE80YF(IDD,JYL,KFM)	DHR Income Eligible Families Demanding Public Day Care on a Fee Basis (family income is between 61% and 80% of the State median income)
FR61YF(IDD,JYL,KFM)	Non-DHR Income Eligible Families Demanding Public Day Care on a Fee Basis (family income is between 80% and 115% of the State median income)
MEDINC	Median Income for the State
PCMDIN(MYD)	Income Eligibility Cut-off Points Percent of State Median Income
RAVINC(JYL)	Rounded-down Average Income (\$)
UUDDCF	Urban Density Demand Correction Factor

Phase 5

<u>Demand Variable</u>	<u>Definition</u>
A. By District and State Totals	
NECDS(IDD)	Children Demanding Public Child Day Care whose Family Income < 115% of the State Median Income - By District

DEMAND	State total of all children in the State demanding public child day care whose family income < 115% of the State median income
N61C80D(IDD)	DHR Income Eligible Children demanding public child day care on a free and fee basis, whose family income is < 80% of the State Adjusted Median Income
NC6180D	State total of DHR Income Eligible Children demanding public child day care on a free and a fee basis
EXCDEM(IDD)	Excess demand after all children demanding service, whose family income < 115% of the State Median Income, have been assigned available slots (children)
EXDEMND	State total of the excess demand (children)
NCHLD(IDD)	Intermediate variable to calculate the excess demand or supply (number of children or slots not served) after all three income eligibility category demand has been offered day care service
STCF61D	State total of DHR Income Eligible Children demanding public day care on a free basis
STCF80D	State total of DHR Income Eligible Children demanding public day care on a fee basis
STC115D	State total of Non-DHR Income Eligible Children demanding public day care on a fee basis
STEXD61	State total for excess demand for DHR Income Eligible - free basis day care category (children)
STEXD80	State total for excess demand for DHR Income Eligible - fee basis day care category (children)

SXD6180	State total for excess demand for DHR Income Eligible - free and fee basis day care category (children)
STEXDNE	State total for excess demand for Non-DHR Income Eligible - fee basis day care category (children)

B. By Age Groups and Districts:

PCRDYCR(IDD,LAG)	Children age group distribution for children demand, children served, children not served (fraction)
NACF61D(IDD,LAG)	DHR Income Eligible Children demanding free public child care: by age group and district (infant, pre-school, school age)
NACF80D(IDD,LAG)	DHR Income Eligible Children demanding public child care on a fee basis: by age group and district
NAC115D(IDD,LAG)	Non-DHR Income Eligible Children demanding public child care on a fee basis: by age group and district
NCHDMAD(IDD,LAG)	Sum of (3 above variables) children demanding public child care on a free and fee basis: by age group and district
NA6180D(IDD,LAG)	DHR Income Eligible Children demanding free and fee basis day care: by age group and district

C. By Age Group:

NCD61AG(LAG)	DHR Income Eligible Children demanding free public child care: by age group
NCD80AG(LAG)	DHR Income Eligible Children demanding public child care on a fee basis: by age group
NC115AG(LAG)	Non-DHR Income Eligible Children demanding public child care on a fee basis: by age group

NCHDMAG (LAG)	All children demanding public child care, whose family income < 115% of the State Median Income: by age group
ND6180 (LAG)	DHR Income Eligible Children demanding public child day care on a free and a fee basis: by age group

Supply Variable

By Districts and State Totals:

SUPSCH (IDD)	Supply (slots) available for public child care in each DHR district
SUPPLY	Total slots available for public child care for the State
SPAVFE (IDD)	Space (slots) available for DHR Income Eligible Children for day care on a fee basis
SPAVNE (IDD)	Space (slots) available for Non-DHR Income Eligible Children for day care on a fee basis
EXSPACE (IDD)	Excess space (slots) after serving all children demanding service whose family income < 115% of the State Median Income
STSPVFE	State total: space (slots) available for DHR Income Eligible Children for day care on a fee basis
STSPVNE	State total: space (slots) available for non-DHR Income Eligible Children for day care on a fee basis
EXCSUP (IDD)	Excess supply after all children, whose family income < 115% of State Adjusted Median Income, have been served by public day care
EXSUPPLY	State total: excess space (slots) after serving all children demanding service whose family income < 115% of the State Median Income

NSD61VR	Intermediate variable to calculate excess demand or supply for DHR Income Eligible - free basis day care category
NSD80VR	Intermediate variable to calculate excess demand or supply for DHR Income Eligible - fee basis day care category
SD6180V	Intermediate variable to calculate excess demand or supply for DHR Income Eligible - free and fee basis day care categories
NSDNEVR	Intermediate variable to calculate excess demand or supply for Non-DHR Income Eligible - fee basis day care category
STEXS61	State total for excess supply for DHR Income Eligible - free basis day care category
STEXS80	State total for excess supply for DHR Income Eligible - fee basis day care category
SXS6180	State total for excess supply for DHR Income Eligible - free and fee basis day care category
STEXSNE	State total for excess supply for Non-DHR Income Eligible - fee basis day care category

Service Variables

A. By Districts and State Totals:

CSRV61 (IDD)	DHR Income Eligible children (whose family income < 61% of the State Median Income) served on a free basis
NCSV61	State total: DHR Income Eligible children served on a free basis
CSRV80 (IDD)	DHR Income Eligible children (whose family income is between 61% and 80% of the State Median Income) served on a fee basis

NCSV80	State total: DHR Income Eligible children served on a fee basis
CSRVNE (IDD)	Non-DHR Income Eligible children (whose family income is between 80% and 115% of the State Median Income) served on a fee basis
NCSVNE	State total: Non-DHR Income Eligible children served on a fee basis
CSV6180 (IDD)	DHR Income Eligible children served on a free and a fee basis
N61SV80	State total: DHR Income Eligible children served on a free and a fee basis
NCHSRVD (IDD)	All children served - DHR and Non-DHR Income Eligible children served on a free and a fee basis (family income is < 115% of the State Median Income)
NTSTSRV	State total: DHR and Non-DHR Income Eligible children served on a free and a fee basis

B. By Age Groups and Districts:

NCSRV61 (IDD, LAG)	DHR Income Eligible children served on a free basis (infant, pre-school, school age)
NCSV61A (LAG)	DHR Income Eligible children served on a free basis: by age group only
NCSRV80 (IDD, LAG)	DHR Income Eligible children served on a fee basis (infant, pre-school, school age)
NCSV80A (LAG)	DHR Income Eligible children served on a fee basis: by age group only
NCS6180 (IDD, LAG)	DHR Income Eligible children served on a free and a fee basis: by district and age group
N61S80A (LAG)	DHR Income Eligible children served on a free and a fee basis: by age group only

NCSRNE (IDD,LAG)	Non-DHR Income Eligible children served on a fee basis (whose family income is between 80% and 115% of the State Median Income)
NCSVNEA (LAG)	Non-DHR Income Eligible children served on a fee basis: by age group only
NCHSVAD (IDD,LAG)	All children served - DHR and Non-DHR Income Eligible children served on a free and a fee basis (whose family income < 115% of the State Median Income)
NCHSVAG (LAG)	All children served - DHR and Non-DHR Income Eligible children served: by age group only

Not Served Variables

A. By Districts and State Totals:

CNSV61 (IDD)	DHR Income Eligible children not served on a free basis
NSVST61	State total: DHR Income Eligible children not served on a free basis
CNSV80 (IDD)	DHR Income Eligible children not served on a fee basis
NSVST80	State total: DHR Income Eligible children not served on a fee basis
CNSVNE (IDD)	Non-DHR Income Eligible children not served on a fee basis
NSVSTNE	State total: Non-DHR Income Eligible children not served on a fee basis
NSC6180 (IDD)	DHR Income Eligible children not served on a free and a fee basis
N61NS80	State total: DHR Income Eligible children not served on a free and a fee basis
NCNSRVD (IDD)	All children not served: DHR and Non-DHR Income Eligible children not served on a free and a fee basis (family income

< 115% of the State Median Income)

NSVSTGT

State total: all children not served - DHR and Non-DHR Income Eligible children not served on a free and a fee basis

B. By Age Groups and Districts:

NCNSV61 (IDD,LAG)

DHR Income Eligible children not served (infant, pre-school, school age) on a free basis

NNSV61A (LAG)

DHR Income Eligible children not served on a free basis: by age group only

NCNSV80 (IDD,LAG)

DHR Income Eligible children not served on a fee basis (infant, pre-school, school age)

NNSV80A (LAG)

DHR Income Eligible children not served on a free basis: by age group only

NNS6180 (IDD,LAG)

DHR Income Eligible children not served on a free and a fee basis: by district and age group

NCNSVNE (IDD,LAG)

Non-DHR Income Eligible children not served on a fee basis (family income is between 80% and 115% of the State Median Income)

NNSVNEA (LAG)

Non-DHR Income Eligible children not served on a fee basis: by age group only

NCNSVAD (IDD,LAG)

All children not served: DHR and Non-DHR Income Eligible children not served on a free and a fee basis (whose family income < 115% of the State Median Income)

NCNSVAG (LAG)

All children not served: DHR and Non-DHR Income Eligible children not served: by age group only

Phase 6

<u>Variable</u>	<u>Definition</u>
I. Fees Received:	
FECHDYF (IDD, JYL, KFM)	Total fees for DHR Eligible children demanding service on a fee basis (family income is between 80% and 115% of the State Median Income) - (\$/child/year)
FECHDY (IDD, JYL)	Total fees for DHR Eligible children demanding service on a fee basis: by district and family income (\$/year)
FECHDM (IDD)	Total fees for DHR Eligible children demanding service on a fee basis: by district only (\$/year)
FENECDYF (IDD, JYL, KFM)	Total fees for Non-DHR Eligible children demanding service on a fee basis (\$/child/year)
FENECDY (IDD, JYL)	Total fees for Non-DHR Eligible children demanding service on a fee basis (\$/year)
FENECD (IDD)	Total fees for Non-DHR Eligible children demanding service on a fee basis: by district only (\$/year)
FEEC80 (IDD)	Fees received for DHR Income Eligible children served on a fee basis: by district (\$/year)
TFEEC80	State totals: fees received for DHR Income Eligible children served on a fee basis (\$/year)
FEECNE (IDD)	Fees received for Non-DHR Income Eligible children served on a fee basis (\$/year)
TFEECNE	State totals: fees received for Non-DHR Income Eligible children served on a fee basis (\$/year)
FEECSV (IDD)	Fees received for DHR and Non-DHR Income Eligible children (\$/year)

TSTFERC	State totals: fees received for DHR and Non-DHR Income Eligible children (\$/year)
TFEESCH(IDD,JYL,KFM)	Interim real variable for determining total projected fees for the districts (\$/year)

II. Child Care Costs:

A. By District and Age Group; By Age Group; By State Totals:	
FRCRCST(IDD,LAG)	Child care costs for DHR Income Eligible children being served on a free basis: by district and age group (\$/year)
TFRCRCT(IDD)	Total child care costs for DHR Income Eligible children being served on a free basis: by district (\$/year)
FRCSTC	State total: child care costs for DHR Income Eligible children being served on a free basis (\$/year)
FECRCST(IDD,LAG)	Child care costs for DHR Income Eligible children being served on a fee basis: by district and age group (\$/year)
TFECRCT(IDD)	Total child care costs for DHR Income Eligible children being served on a fee basis: by district (\$/year)
FECSTC	State total: child care costs for DHR Income Eligible children being served on a fee basis (\$/year)
FRFECST(IDD,LAG)	Child care costs for DHR Income Eligible children being served on a free and fee basis: by district and age group (\$/year)
TFRFECT(IDD)	Child care costs for DHR Income Eligible children being served on a free and fee basis: by district only (\$/year)
TTFRFEC	State totals: child care costs for DHR Income Eligible children being served on a free and fee basis (\$/year)

FENECST(IDD,LAG)	Child care costs for Non-DHR Income Eligible children being served on a fee basis: by district and age group (\$/year)
TFENECT(IDD)	Child care costs for Non-DHR Income Eligible children being served on a fee basis: by district only (\$/year)
FENESTC	State total: child care costs for Non-DHR Income Eligible children being served on a fee basis (\$/year)
TCRCST(IDD,LAG)	Total child care costs for DHR and Non-DHR Income Eligible children being served on a free and fee basis: by district and age group (\$/year)
TTCRCST(IDD)	Total child care costs for DHR and Non-DHR Income Eligible children being served on a free and fee basis: by district only (\$/year)
TSTCST	State total: child care costs (\$/year)
 B. By Age Group:	
TFRAGCT(LAG)	Child care costs for DHR Income Eligible children being served on a free basis: by age group (\$/year)
TFEAGCT(LAG)	Child care costs for DHR Income Eligible children being served on a fee basis: by age group (\$/year)
FRFEACT(LAG)	Child care costs for DHR Income Eligible children being served on a free and fee basis: by age group (\$/year)
TFNEACT(LAG)	Child care costs for Non-DHR Income Eligible children being served on a fee basis: by age group (\$/year)
STFRACT	State totals: child care costs for DHR Income Eligible children being served on a free basis (\$/year)
STFEACT	State totals: child care costs for DHR Income Eligible children being served on a fee basis (\$/year)

TFRFEAC	State totals: child care costs for DHR Income Eligible children being served on a fee and free basis (\$/year)
STFNACT	State totals: child care costs for Non-DHR Eligible children being served on a fee basis (\$/year)
TCSTAGE (LAG)	Child care costs for DHR and Non-DHR Income Eligible children being served on a free and fee basis: by age group (\$/year)
STGTCST	State totals: child care costs for DHR and Non-DHR Income Eligible children being served on a free and fee basis (\$/year)

III. Government and Private Costs:

PRVDHRC (IDD)	Private costs (fees received) for DHR Income Eligible children served on a fee basis (\$/year)
PVNDHRC (IDD)	Private costs (fees received) for Non-DHR Income Eligible children served on a fee basis (\$/year)
TPVNDHC	State totals: Fees received for Non-DHR Income Eligible children served on a fee basis (\$/year)
GOVTCST (IDD)	Government costs for child care for DHR and Non-DHR Income Eligible children being served on a free and fee basis (\$/year)
TGVTTCST	State totals: government costs for child care for DHR and Non-DHR Income Eligible children being served on a free and fee basis (\$/year)
PRVCST (IDD)	Private costs (fees received) for DHR and Non-DHR Income Eligible children served on a fee basis (\$/year)
TPRVCST	State totals: Fees received for DHR and Non-DHR Income Eligible children served on a fee basis (\$/year)

GVTDHRC (IDD)	Net government costs after deducting fees received from DHR Income Eligible families. Includes costs for children served on a free basis (\$/year)
TGFRFEC	State totals: net government costs after deducting fees received from DHR Income Eligible families (\$/year)
GVNDHRC (IDD)	Net government costs after deducting fees received from only Non-DHR Income Eligible families (\$/year)
TGVNDHC	State totals: net government costs after deducting fees received from only Non-DHR Income Eligible families (\$/year)

Phase 7VariablesDefinition

CHGSUP (IDD)	Change factors to modify Supply Schedule at beginning of each time period (fraction)
NCHGSUP (IDD)	Number of slots the Supply will be increased or decreased (slots)
CGRTFDG (JYL)	Change factors to modify rural districts in the Families in Georgia Matrix (fraction)
CGUTFDG (JYL)	Change factors to modify urban districts in the Families in Georgia Matrix (fraction)
TCLOCK	Simulation clock keeping track of time (years)
TIME	Input variable that sets the length of the simulation run (years)

APPENDIX B**USER DOCUMENTATION**

The input data formats (with base run data) appear in Table B-1 through B-12. The last column is the data file line number. These data line numbers correspond to the input variables and read statements as shown in Figure B-1 . A data field with a series of 9's means that the particular matrix cell value is not meaningful for that variable. A series of asterisks will appear in the printout of the variable.

The program provides the user the option to select combinations of 13 printouts of input and output data (Table B-13). The user can exercise these options through the input values of the vector ISWITCH. When an ISWITCH value is equal to zero, the program suppresses a given section of output as indicated in Table B-13. For complete printout, all ISWITCH values are set to one. In this mode, the program prints out all input and output data for the first time period. For all subsequent time periods, the variable TCLOCK allows printing of variables that change value with time. These variables are included in the following sections controlled by the ISWITCH numbers indicated:

<u>ISWITCH Number</u>	<u>Printout Sections</u>
3	Family Matrix
10	Supply and Demand Analysis
11	Demand and Service (Usage) Analysis
12	Financial Analysis
13	Summary of Financial Analysis

Computations and variables not affected by the passage of time
