# SYNTHESIS AND PHARMACOLOGY OF POTENTIAL SITE-DIRECTED THERAPEUTIC AGENTS FOR COCAINE ABUSE 

## Approved:

David M. Collard, Co-Chairman<br>Howard M. Deutsch, Co-Chairman

Suzanne B. Shuker

Christoph J. Fahrni

Margaret M. Schweri

Date Approved: June 16, 2004

## DEDICATION

This thesis is dedicated to my daughter, Serina, for her compassionate and understanding heart, for her comfort during the most trying and difficult times in our lives, and for her willingness to endure this struggle by my side.

## ACKNOWLEDGEMENTS

First, and above all, I would like to thank God for guiding me through life and allowing me to finish this incredible challenge. I would like to thank my advisors, Dr. David M. Collard and Dr. Howard M. Deutsch for their understanding, support, mentorship, and guidance. I know I would not have been able to accomplish as much without the week-to-week encouragements and challenges. I would like to thank Dr. Margaret M. Schweri at the Mercer School of Medicine for participating on my committee, for the in vitro testing of my compounds, and for her care in reviewing my thesis. I would also like to thank the other members of my committee, Dr. Suzy B. Shuker and Dr. Christoph Fahrni for their time and effort. I would like to thank Dr. Stephan G. Holtzman at Emory University for the in vivo experiments and data. I would like to thank Dr. Les Gelbaum for all the wonderful NMR experiments which he patiently took the time to teach me. Thanks to Dr. Vanderveer, who is currently at Clemson Univeristy, and Dr. Kenneth Hardcastle at Emory University for the x-ray diffraction data. I would like to thank Dr. Sahar Javanmard for the in vitro testing which she completed at Emory University and her wonderful friendship while working in the lab. I would like to thank all the group members (past and present) who helped in so many different ways during the day and night. A special thanks to Dr. Genara Andrade and Leezah Roberts for being there during those roller coaster rides. I appreciate all the columns done by Jennifer Dudek, the columns and synthesis done by Robert Busch, and the columns and melt points done by Christine Fennessey. Thanks to Dr. Deog-Il-Kim for
all of his assistance and wisdom. Thanks to David Bostwick for all my GC/MS analysis. I would like to thank my family and friends for their endless love and support. Last but not least, I would like to thank my husband for all his help during some very stressful moments.

## SUMMARY

Stimulants such as cocaine continue to dominate the nation's illicit drug problem. An effective medication for any aspect of cocaine addiction has not been developed. Cocaine binds, although not selectively, to the dopamine transporter (DAT) and disrupts normal dopamine (DA) neurotransmission between neurons. While the "dopamine hypothesis" for the mechanism of action of cocaine has been widely accepted, cocaine also possesses the ability to block the uptake of serotonin at the serotonin transporter (5HTT) and norepinephrine at the norepinephrine transporter (NET). The purpose of the work described herein is directed towards synthesizing and testing compounds selective for the DAT, leading to the identification of candidates as potential pharmacotherapies for cocaine dependence.

A series of disubstituted and trisubstituted [2.2.2] and [2.2.1]bicycles were synthesized and tested for inhibitor potency in $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 (WIN) binding at the DAT and for inhibition of $\left[{ }^{3} \mathrm{H}\right]$ DA uptake. Based on results from some of the pharmacology data new regio- and stereochemical isomers of bicyclic [2.2.1]heptanes and [2.2.2] octanes were synthesized. This will lead to further structure-activityrelationships, which will provide a better understanding of the structural requirements needed to bind at the DAT.

## CHAPTER I

## AN INTRODUCTION TO THE DEVELOPMENT OF POTENTIAL PHARMACOTHERAPIES FOR COCAINE ADDICTION

## Background

First isolated from the coco leaves (erythroxylon coca) as a naturally occurring local anesthetic, (-) cocaine (1, Figure 1.1) has become problematic and a safety hazard due to its powerful reinforcing effects on individuals and society. ${ }^{1}$ Cocaine is a widely abused drug with strong addiction liabilities that need to be further understood. To date, an effective medication for any aspect of cocaine addiction does not exist. Our work is directed towards combining medicinal chemistry and preclinical pharmacology to design, synthesize, and test site-directed compounds leading to the identification of candidates as potential pharmacotherapies for cocaine dependence. ${ }^{2}$ While considerable effort has been expended in the study of the mechanism of action of cocaine, the details are still under investigation. Studies show cocaine binds, although not selectively, to the $\mathrm{DAT}^{3,4,5,6}$ and disrupts normal DA neurotransmission between neurons (Figure $1.2^{7}$ ). Vesicles in the presynaptic

Figure 1.1. Potent DA Uptake Inhibitors.
neuron release DA into the synaptic cleft between neurons when an electrical impulse is transduced through the neuron. The DA released into the synapse binds to a receptor protein on the postsynaptic neuron. Upon binding to the receptor, DA activates the neuron and the electrical impulse is transduced through the receiving neuron. Once the receiving neuron has been activated, the DA is released by the receptor protein and taken back up into the presynaptic neuron via the DAT. When cocaine is present it blocks reuptake of DA back into the presynaptic neuron due to competitive binding between DA and cocaine at the DAT. Excess amounts of DA accumulate in the synapse, which prolongs neurotransmission and, in turn, produces a reinforcing effect or the characteristic cocaine "high". ${ }^{8}$ Activation of postsynaptic receptors alone does not appear to be sufficient to lead to addiction. Rather, it is the rapid onset and short duration of action of cocaine and concomitant surge in available DA that presumably accounts for the rapid cycles observed clinically and the high addiction potential of cocaine. While the "dopamine hypothesis" for the mechanism of action of cocaine has been widely accepted, cocaine also possesses the ability to block the uptake of serotonin at the serotonin transporter (5-HTT) and norepinephrine at the norepinephrine transporter (NET). ${ }^{9,10}$

Evidence exists for two distinct binding sites for dopamine and cocaine on the DAT, which may, or may not, overlap. ${ }^{11,12,13}$ This creates the possibility of producing a therapeutic agent that will block the binding of cocaine to the DAT, but will allow the reuptake of DA into the transmitting neuron (i.e., a cocaine antagonist). An alternate candidate would elicit some of the same effects in the user as cocaine itself,

Figure 1.2. Dopamine neurotransmission with/without cocaine present. ${ }^{7}$
but not cause the same degree of euphoria. The most promising of these drugs would be a long lasting, slow onset, cocaine agonist.

To date, the search for compounds to be used in the development of safe and effective treatment agents for cocaine addiction has led to the synthesis of a number of tropane and non-tropane compounds. Among these compounds are WIN 35,428 and 35,065-2 (2a and 2b, respectively), ${ }^{14}$ GBR 12909 (3), ${ }^{15}$ methylphenidate (4), ${ }^{16}$ and LR $5182(5)^{17}$ (Figure 1.1), which have all been reported to demonstrate potential as cocaine abuse therapeutic agents. The structural analogy of the WIN analogues to cocaine is obvious. The binding affinity of WIN $35,065-2$ to the DAT is 8 times greater than that of cocaine. One of the main structural differences between cocaine and GBR 12909 is the non-tropane, disubstituted, piperazine ring. GBR 12909 binds potently to the DAT and produces a relatively modest and long lasting increase in the DA concentration in the synapse, which does not cause the same degree of euphoria as cocaine. LR 5182, a potent stimulant, also does not contain the tropane core of cocaine, but molecular modeling suggests a high degree of analogy between the three-dimensional spatial arrangement of structural features (the phenyl ring and nitrogen) of cocaine and LR 5182. The stimulant properties of methylphenidate are also believed to arise from its structural homology with cocaine, and a common mode of binding the phenyl rings and the basic nitrogen at the DAT.

The $\mathrm{IC}_{50}$ values for inhibition of $\left[{ }^{3} \mathrm{H}\right]$ DA uptake ${ }^{18}$ and the inhibition of ligand binding to the DA, ${ }^{19}$ norepinephrine (NE), ${ }^{20}$ and 5-hydroxytryptamine (5-HT, serotonin) transporters have been used as comparative measures to determine the extent of binding and the selectivity for the different biogenic amine transporters. ${ }^{21}$

*Reported as the $\mathrm{K}_{\mathrm{i}}$.
The experiments were performed under the supervision of Dr. Margaret M. Schweri at Mercer School of Medicine.

The bicyclic LR5182 is potent for inhibition of both WIN binding and DA uptake (Table 1.1), leading to our interest in derivatives of LR 5182. A number of LR 5182 analogs show potential as therapeutic agents ${ }^{17}$ by combining the potency and selectivity of GBR derivatives in a conformationally restricted structure bearing more
similarity to cocaine. Modification of the rigid framework (stereochemistry, substituents on the framework and phenyl ring, type of amine, etc.) allow the determination of structure-activity relationships, which will aid in the development of therapeutic agents.

The DAT has been cloned and the binding site for DA described. ${ }^{22}$ The human DAT (hDAT) is comprised of 620 amino acids, putatively arranged in 12 interconnected helices to form transmembrane channels (Figure 1.3). Each helical domain presents its polar amide linkages toward the core of the helix. This places the amino acid side chain on the outside of the helix facing the internal structure of the channel. Site-mutagenesis studies show that the aspartic acid residue lying within the putative hydrophobic transmembrane domain 1 (TMD 1) is crucial for DAT function (Figure 1.4). An explanation for this observation is that the carboxylic acid of aspartic acid 79 interacts with the amine of DA to play a crucial role in DA transport. ${ }^{11}$ This amino acid may also recognize the tropane nitrogen of cocaine to participate in cocaine binding. These studies also show two serines in TMD 7 (359 and 354) play an important role by hydrogen bonding to the two hydroxyl groups of DA. It is still uncertain whether cocaine interacts with the same amino acids of the DAT in the same manner. As of yet, no crystallographic data is available that clearly defines how the DAT is actually configured in membranes in its functional state.

The development of structure-activity relationships has led to a proposed pharmacophore for cocaine (Figure 1.5). The model, proposed by Carroll et al., ${ }^{23}$ consists of an electrostatic or hydrogen bond site on the DAT to interact with the basic amino group of cocaine. It is speculated that one or two additional hydrogen bonding sites in the pharmacophore binds to the two oxygen atoms of the ester group of cocaine.

Figure 1.3. Proposed model for the DAT as a transmembrane channel. ${ }^{24}$

Figure 1.4. Depiction of the interactions of DA at the DAT. ${ }^{25}$

Figure 1.5. Proposed pharmacophore by Carroll et al. ${ }^{23}$

Recent studies have shown the replacement of the methyl ester group by ketones, ${ }^{26}$ heterocycles,,${ }^{27}$ amides, ${ }^{28}$ alkyl groups, ${ }^{29}$ and olefins ${ }^{30}$ did not decrease the potency at the DAT. A hydrophobic pocket, which is believed to accommodate the benzoate group, has also been suggested. An important structural feature of all uptake inhibitors is an aromatic ring situated in such a way that it may interact with this "aromatic ring binding site" of the transporter protein. Structure-activity studies have also
shown that halogens in the 3- or 4-position on this aromatic ring often increase the binding potency. A more elaborate pharmacophore, Figure $1.6^{31}$, has been proposed which suggests: i) the tropane nitrogen and the phenyl ring should be in the same plane for optimal binding; ii) the distance from the nitrogen to the centroid of the phenyl should be 5 to 7 Ångstroms; iii) the distance from the nitrogen to the carbonyl should be 2.2 to 4.5 Ångstroms; and iv) the distance from the centroid of the phenyl ring to the carbonyl should be 3.4 to 6.1 Ångstroms.

Figure 1.6. A 3-D pharmacophore model derived from cocaine by Johnson et al. ${ }^{31}$

Recently, a series of 2-substituted-6-amino-5-phenylbicyclo[2.2.2]octanes were synthesized and tested for inhibitor potency in $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 (WIN) binding at the DAT and for inhibition of $\left[{ }^{3} \mathrm{H}\right]$ DA uptake (Table 1.2). ${ }^{32}$ The $\left[{ }^{3} \mathrm{H}\right]$ DA uptake data is not shown in Table 1.2 but shows the same trends as that for $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding. Data presented in Table 1.2 indicates the endo-amines are more potent than the corresponding exo-amines and the ketones are similar in potency to the corresponding exo-acetates. The benzoate esters inhibited the uptake of $\left[{ }^{3} \mathrm{H}\right] \mathrm{DA}$ better than the corresponding alcohols and the stereochemistry at C-2 has little effect on the potency. The endo-amino-endobenzoate 6 and the endo-amino-endo-4-chlorobenzoate 7 were the two most potent derivatives made from this series with an $\mathrm{IC}_{50}=270 \mathrm{nM}$ and $\mathrm{IC}_{50}=295 \mathrm{nM}$, respectively. Moving the halogen from the para position on the benzoate phenyl ring to the meta position did not affect the potency ( $7 \mathrm{vs} \mathbf{8}$ ). These values are comparable to that of (-) cocaine $\left(\mathrm{IC}_{50}=160 \mathrm{nM}\right)$. Clearly, the second phenyl group present in benzoate $\mathbf{6}$, enhances the potency of these compounds.

Preliminary research to extend this study focused on this secondary effect on binding to the DAT to determine the relative importance of the two phenyl rings (the benzoate at C-2 and the phenyl at C-5) and to further explore structure-activity relationships. ${ }^{33}$ One approach we took was to prepare esters $\mathbf{8}$ and $9,{ }^{34}$ as analogs of $\mathbf{6}$. A second approach to determine structure-activity-relationships of substituted bicycloalkane analogs of 6 was to prepare the analog without the phenyl ring at C-5, i.e. 10. ${ }^{34}$ Derivative $\mathbf{9}$ is the most potent compound with an $\mathrm{IC}_{50}=33 \mathrm{nM}$ (Table 1.2) for $\left[{ }^{3} \mathrm{H}\right] \mathrm{WIN}$ binding and an $\mathrm{IC}_{50}=137 \mathrm{nM}$ for the DA uptake. Congener 9 shows high

$\mathrm{Ar}=4$-chlorophenyl
Ar' $=3$-chlorophenyl
binding affinity at the dopamine transporter, with about an 8 -fold increase in potency over endo-amino-endo-benzoate 6. Derivative 10, with an $\mathrm{IC}_{50}=21700 \mathrm{nM}$, is 8 times less potent than endo-amino-endo-benzoate 7. Removal of the phenyl ring at C-5 clearly demonstrates a decreased interaction between the des-phenyl 10 and the "aromatic ring binding site" on the DAT.

## Scope of Thesis

In Chapter 1 of this thesis, the effect of removing the phenyl at the C-5 position of the bicycle is further evaluated by isolating the other three desphenyl diastereomers of bicycloalkane analog 10, structure 11 (Figure 1.7). Extensive analysis of the structural changes allow for the development of SARs, which may be related to the fit of these compounds with the proposed active site. These compounds will provide guidance in the design of new derivatives with cocaine agonist and antagonist activity.

To further evaluate the role of the phenyl substituent on the endo-amino 2,6disubstituted [2.2.2]bicycle $\mathbf{1 0}$ mentioned above, the ester functionality was excised ${ }^{35}$ (Chapter 2). An arene was attached directly to the bicyclic framework or by a one or two carbon linker, e.g. arenes 12, Figure 1.7. These homologues will help determine the distance between the nitrogen and the phenyl ring for optimal binding. Increasing the number of carbons between the bicycle and the phenyl ring increases the flexibility, which may be needed to allow the phenyl ring to adopt a low energy conformation to bind to the active site. Lengthening the distance between the nitrogen and phenyl ring could render the distance too long, and as a result, decrease the potency of the
compounds. The excision of the ester is also expected to increase the half-life of the molecule in vivo, since it will not be subject to hydrolysis by esterases.

Chapter 3 discusses another approach taken to further understand the role of the phenyl ring, the transposition of the benzoate from the $\mathrm{C}-2$ position on the bicycle to the C-3 position, e.g. structure 13. Thus, extensive analysis of the structural changes allows for the development of SARs related to the fit of these compounds at the active site of the

## DAT.

An additional challenge has been to construct compounds which fill the gap between carbons 2 and 3 on the disubstituted [2.2.2]octanes discussed above. In Chapter 4, an approach is described which is based on disubstituted [2.2.1]heptanes, structures $\mathbf{1 4}$ and 15 (Figure 1.7). One can imagine the one-carbon bridge occupying a position so as to orient the phenyl substituent in an orientation between that occupied in the 2,5 and 2,6 disubstituted [2.2.2]octanes. The benzoate is placed on the one-carbon bridge for a direct comparison with the compounds already made. The substituents on the bicycle are exchanged so as to place the benzoate on the two-carbon bridge and the dimethylamine on the one-carbon bridge, benzoates 15. By exchanging the substituents, a direct comparison of compounds containing an unsubstituted carbon adjacent to the amine or benzoate can be made with those compounds where the substituent is placed on the one carbon bridge. Placing the amine on the one-carbon bridge will also allow for a comparison with cocaine due to the resemblance in structure.

Since the most potent compounds of the trifunctional [2.2.2]bicyclic series synthesized previously in the our group were benzoate esters, ${ }^{32}$ a challenge was to introduce a benzoate ester on the bicyclic [2.2.1]heptane skeleton to allow for comparison
to previously synthesized 2-( $N, N$-dimethylamino)methyl-3-phenyl bicyclo[2.2.1]heptanes (Chapter 5). Compounds 16 and $\mathbf{1 7},{ }^{2}$ Figure 1.7, were of interest because of the difference in the inhibitor potency in $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 (WIN) binding at the DAT. The only difference between compounds $\mathbf{1 6}$ and $\mathbf{1 7}$ is the trans stereochemistry at the C-2 and C-3 position on the bicycle. This variation in the structures leads to a difference in potency of 515 nM for the trans endo-amine 16 versus 2510 nM for the trans exo-amine 17, a 5-fold increase. Based on the trends seen with the series of 2-substituted-6-amino-5phenylbicyclo[2.2.2]octanes (Table 1.2), a benzoate ester of $\mathbf{1 8}$ may increase the potency of these amines. The placement of the 4-chloro substituent on the phenyl ring may also increase the potency of these compounds.

The series of [2.2.1] and [2.2.2]bicycloalkane analogs already synthesized provide a guide in the design of new derivatives with cocaine agonist and antagonist activity. The synthetic work described will provide further insight into the development of SARs for inhibition of cocaine binding.

## Specific Goals

The goals of this thesis are to design, synthesize, characterize and pharmacologically investigate new regio- and stereochemical isomers of bicyclic [2.2.1]heptanes and [2.2.2] octanes. This will lead to further structure-activity relationships, which will provide a better understanding of the structural requirements needed to bind at the DAT. This will in turn help identify potential pharmacotherapies for cocaine dependence.

## CHAPTER II

## SYNTHESIS AND PHARMACOLOGY OF 2-BENZOYL-6-

## AMINO[2.2.2]BICYCLOOCTANES

## Introduction

Previous work in our group incorporated an oxygen functionality at the C-2 position of 6-amino-5-phenylbicyclo[2.2.2]octanes. ${ }^{1}$ The more potent of these esters are the benzoates, containing two phenyl groups (the ester phenyl ring and the phenyl ring at C-5 of the bicyclic moiety). Based on the binding data shown in Table 1.2, the second phenyl group present in benzoate $\mathbf{6}$ enhances the potency of these compounds (Figure 2.1). Since two phenyl rings are present, an uncertainty exists as to which phenyl ring binds to the hydrophobic pocket (aromatic binding region) of the various monoamine transporters. While attempting to determine with more certainty the influence of the phenyl rings (the benzoate at $\mathrm{C}-2$ or the phenyl ring at $\mathrm{C}-5$ ) on benzoate $\mathbf{6}$, three other stereoisomers of the desphenyl analog 10, congeners 26-28, were synthesized (Figure 2.1). Using MM2 energy-minimized conformations ${ }^{2}$ the distances between the nitrogen and the centroid of the phenyl ring were calculated for each of these compounds. The

28

Figure 2.1. Benzoates 6, 10, and 26-28.
distance varied between 5.4 and 8.69 Ångstroms for benzoates 10, 26-28. The distance from the nitrogen to the plane of the phenyl ring was also calculated for each of these compounds, with the distance varying between 0.004 and 0.281 Ångstroms. Based on the pharmacophore suggested by Johnson et al, ${ }^{3}$ the distance from the nitrogen to the centroid of the phenyl ring should be 5 to $7 \AA$ Á to provide a good fit with the binding site. All benzoates met this criteria, except benzoate 28. Figure 2.2 shows an overlay of cocaine and benzoates 26a and 28. Comparison of the $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding and the inhibition of $\left[{ }^{3} \mathrm{H}\right]$ DA uptake data will help to further characterize the binding affinity at the active site of the DAT.

## Chemistry

The syntheses of benzoate stereoisomers 26a, 26b, 27, and $\mathbf{2 8}$ are shown in Figure 2.3. The mixture of endo- and exo-amino ketones 19 and 20 was previously synthesized. ${ }^{5}$ The 4:1 diastereomeric mixture (determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy, based on ratio of signals $\delta 2.60$ and $\delta 2.57 \mathrm{ppm}$ ) of endo-keto amine $\mathbf{1 9}$ and exo-keto amine 20 were separated by flash column chromatography. The relative stereochemistry of endo-amino ketone 19 was assigned using ${ }^{1} \mathrm{H}$ NMR spectroscopy (Appendix A). The ${ }^{1} \mathrm{H}$ NMR spectrum shows a peak at $\delta 2.18 \mathrm{ppm}$, which was assigned to the exo proton on C-3. This peak is coupled to the exo proton on C-5 by an in-plane W coupling, and shows cis coupling with the exo proton on C-6. Reduction of amino ketone 19 with $\mathrm{NaBH}_{4}$ in absolute EtOH provided a 2:3 mixture (determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy, based on ratio of signals $\delta 3.90$ and $\delta 4.20 \mathrm{ppm}$ ) of diastereomeric endo- and exo-alcohols 21 and 22. The reduction of ketone $\mathbf{2 0}$ with $\mathrm{NaBH}_{4}$ in absolute EtOH provided a 1:1 mixture (determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy, based on ratio of signals $\delta 4.02$ and $\delta 3.89 \mathrm{ppm}$ ) of diastereomeric endo- and exo-alcohols 23 and 24. The diastereomers were separated using column chromatography. The assignment of the relative stereochemistry of exoamino alcohol 24 was done using ${ }^{1} \mathrm{H}$ NMR spectroscopy (Appendix B). The carbinol proton at C-2 of exo-amino alcohol 24 shows a doublet of doublet of doublet of doublets at $\delta 3.89 \mathrm{ppm}$ due to cis coupling ( 9.6 Hz ) with the endo proton on C-3, trans coupling (3.3 Hz) with the exo proton on C-3, coupling to the bridgehead at C-1 $(3.3 \mathrm{~Hz})$, and an in- plane "W-coupling" $(0.9 \mathrm{~Hz})$ to the exo proton on C-7. This is the only arrangement of atoms on the bicycle which would allow the in-plane "W-coupling". The relative stereochemical assignment was confirmed by x-ray diffraction. Treatment of the

Figure 2.3. Synthesis of Derivatives 10, 26-28.
appropriate alcohol with benzoyl chloride gave the corresponding benzoate esters 26-28.
The stereochemistry assignment for benzoate $\mathbf{1 0}$ was published previously. ${ }^{6}$ Benzoate 26a must have the ester functionality exo at C-2 while maintaining the endo stereochemistry of the amino ketone at C-6. The stereochemistry assignment of exo-amino-endo-benzoate $\mathbf{2 8}$ was established using single crystal x-ray crystallography (Appendix C). By process of elimination, compound 27 must contain the benzoate exo at C-2 and the exo stereochemistry at C-6.

## Pharmacology

The benzoate amines, 26-28, were tested to determine the $\mathrm{IC}_{50}$ values for the inhibition of $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding to the DAT and the inhibition of $\left[{ }^{3} \mathrm{H}\right]$ DA uptake into synaptosomes according to established protocols. ${ }^{6}$ The inhibition of $\left[{ }^{3} \mathrm{H}\right] 5-$ hydroxytryptamine(5-HT, serotonin) was also tested using citalopram or paroxetine to determine the selectivity for the DAT.

## In Vitro Testing

## Inhibition of WIN Binding, Citalopram Binding, and $\left[{ }^{3} \mathrm{H}\right]$ DA Uptake

Previous work provided congener $\mathbf{6}^{1}$ which shows inhibition of $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding comparable to that of cocaine $\left(\mathrm{IC}_{50}=270 \mathrm{nM}\right.$ vs 160 nM , respectively, Table 2.2). Additional experiments, ${ }^{7}$ show that derivative $\mathbf{9}$ is the most potent trisubstituted [2.2.2]bicyclooctane with an $\mathrm{IC}_{50}$ of 33 nM for $\left[{ }^{3} \mathrm{H}\right]$ WIN binding and an $\mathrm{IC}_{50}=137 \mathrm{nM}$ for

DA uptake. Derivative 9 (which contains a 4-chloro substituent on the C-5 phenyl ring) is eight times more potent than cocaine for $\left[{ }^{3} \mathrm{H}\right]$ WIN binding. We proposed that this increase in potency is due to a greater interaction between the "aromatic ring binding region" on the DAT and the 4-chlorophenyl ring at C-5 on the bicyclic framework. Desphenyl analogue $\mathbf{1 0}$ shows a low binding affinity at the dopamine transporter with about an 80-fold decrease in potency than endo-amino-endo-benzoate $6\left(\mathrm{IC}_{50}=21700 \mathrm{nM}\right.$ vs 270 nM , respectively).

The exo-amino diastereomeric analogs of $\mathbf{1 0}$, benzoates 27 and $\mathbf{2 8}$, were tested for inhibition of $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding $\left(\mathrm{IC}_{50}=6460 \mathrm{nM}\right.$ and 9410 nM , respectively $)$ and DA uptake $\left(\mathrm{IC}_{50}=21800 \mathrm{nM}\right.$ and 30700 nM , respectively). Both analogs are less potent than exo-benzoate-endo-amine 26a, which is equipotent with cocaine for WIN binding ( $\mathrm{IC}_{50}$ of 193 nM versus 160 nM , respectively). Analogue 26a is slightly selective for the DAT over the 5 -HTT (1.60/.192 $=8.4$-fold). Thus, congener 26a constitutes a new lead compound for further exploration.

Preliminary test results shows potency was lost by the inclusion of a 4-chloro substituent on the phenyl ring, benzoate 26b versus 26a ( $\mathrm{IC}_{50}=6500 \mathrm{nM}$ versus 192 nM , respectively). This can be understood in terms of the para- chloro substituent increasing the size of the aryl substituent beyond the requirements needed for a good fit at the DAT. However, this is unusual since it has been demonstrated in the literature that substitution of the phenyl group with a halogen tends to increase the potency with which a drug binds to the DAT. A second sample of benzoate 26b was submitted to verify these results.

## In Vivo Testing

## Drug Discrimination

In drug discrimination experiments with rats ${ }^{8}$, benzoate 26a shows very little activity at the 3 and $10 \mathrm{mg} / \mathrm{kg}$ dosage (Figure 2.4) compared with cocaine, which shows a slight increase in activity at $1 \mathrm{mg} / \mathrm{kg}$ and $0.3 \mathrm{mg} / \mathrm{kg}$, respectively (Figure 2.5). More than half of the rats tested at $30 \mathrm{mg} / \mathrm{kg}$ were able to discriminate the test drug injection from the saline injection of benzoate 26a $\left(\mathrm{ED}_{50}=29.17\right)$. Although benzoate 26a was equipotent as cocaine by comparing WIN binding $\left(\mathrm{IC}_{50}=192 \mathrm{nM}\right.$ vs $\mathrm{IC}_{50}=160 \mathrm{nM}$, respectively) the drug discrimination experiment shows a difference of 11 -fold in potency $\left(\mathrm{ED}_{50}=93.9 \mathrm{uM}\right.$ versus $\mathrm{ED}_{50}=8.45 \mathrm{uM}$, respectively $)$ when comparing benzoate 26a and cocaine. This difference could be due to cocaine getting to the brain faster than congener 26a.

## Locomotor Stimulation

The locomotor activity reported for analogue 26a is shown in Figure 2.6. Some unusual activity peaks in the control are seen at 90 and 200 minutes. Since these peaks are not common it is believed the activity is due to some outside aggravation in the environment affecting the rats. Analogue 26a was tested at 3, 10, and $30 \mathrm{mg} / \mathrm{kg}$ over 240 minutes. The normal spike in activity is seen with all three concentrations, with the 10 and $30 \mathrm{mg} / \mathrm{kg}$ reaching a maximum at almost 3,000 counts. Cocaine shows counts of 7,000 for a dose of $30 \mathrm{mg} / \mathrm{kg}$, and 9,000 with a dose of $56 \mathrm{mg} / \mathrm{kg}$, and a more gradual decrease in the locomotor stimulation (Figure 2.7). The decrease in locomotor activity compared to that of cocaine, maybe an indicator that congener 26a is consumed quicker by the body than cocaine.

Table 2.2. Data for $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding, $\left[{ }^{3} \mathrm{H}\right]$ DA Uptake, and 5 -HT $\left[{ }^{3} \mathrm{H}\right]$ CIT binding. ${ }^{9}$

## Conclusions

A series of 6-( $N, N$-dimethylamino)-2-benzylbicyclo[2.2.2]octanes was prepared by reduction of amino ketones 19 and 20, followed by benzoylation of the corresponding alcohols. No clear trends could be ascertained from the data in Table 2.1. The exo-benzoate-endo-amine 26a is equipotent with cocaine for WIN binding $\left(\mathrm{IC}_{50}=193 \mathrm{nM}\right.$ vs 160 nM ) and is 8 -fold more selective for the DAT over the $5-\mathrm{HTT}$. The in vivo pharmacology indicates that congener 26a is 8 -fold less potent than cocaine by drug discrimination $\left(\mathrm{ED}_{50}=6.47 \mathrm{uM}\right.$ versus $\mathrm{ED}_{50}=0.855 \mathrm{uM}$, respectively $)$ and the locomotor activity is not as high as that for cocaine ( 3,000 counts versus 7,000 counts, respectively). The data obtained from the in vivo pharmacology testing can be interpreted in the following manner: 1) the drug discrimination results may be the result of a slower on-set, and 2) the locomotor activity may be the result of the drug being metabolized faster than cocaine. Further structure-activity relationships will be developed based on this new lead compound.

## Experimental Section

General Methods. All starting materials were used as received from Aldrich Chemical Company. Melting points were determined on a Mel-Temp apparatus and are uncorrected. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were obtained on a Varian Gemini spectrometer at 300 MHz and 75 MHz , respectively, unless otherwise noted. COSY and HMQC spectra were recorded on a Bruker AMX 500 MHz . Fourier transform infrared spectra were obtained using a Nicolet 520 FTIR spectrometer. Gas chromatography-mass spectroscopy was performed on a HP 5890 gas chromatogram coupled to a VG 70SE mass spectrometer. Elemental analyses were obtained from Atlantic Microlabs, Norcross, Georgia. Tetrahydrofuran (THF) was dried over sodium benzophenone ketyl prior to distillation under nitrogen. Benzene was dried over $4 \AA$ molecular sieves. Amines were dissolved in minimum amount of MeOH and were converted to HCl salts by the addition of 1.5 equivalents of concentrated 1 M HCl in diethyl ether. MeOH was added and the HCl was removed under reduced pressure. The resulting solid was recrystallized from $\mathrm{MeOH} / \mathrm{EtOAc}$ or EtOAc/hexane.

The synthesis of a mixture endo- and exo-6-(N,N-dimethylamino)bicyclo[2.2.2] octan-2-ones, $\mathbf{1 9}$ and $\mathbf{2 0}$ was reported previously. ${ }^{10}$ The exo-amino ketone isomer 20 ( $0.424 \mathrm{~g}, 16.2 \%$ yield) was eluted from the silica column first (silica gel, 1:1:30 ethyl acetate:methanol:chloroform) and isolated as a brown liquid, followed by the endo-amino ketone isomer 19 ( $2.03 \mathrm{~g}, 77.7 \%$ yield), which was isolated as a brown solid.

## CHAPTER III

## SYNTHESIS AND PHARMACOLGY OF 2-AMINO-6-

## ARYLBICYCLO[2.2.2]OCTANES

## Introduction

The work in this chapter is a continuation of the work described in Chapter 2. In Chapter 2, a series of 6-amino-[2.2.2]bicyclo-2-benzoates (26-28) was synthesized and pharmacologically assessed. The phenyl substituent was introduced through a benzoate ester linkage at the C-2 position of the bicycle. endo-Amino-exo-benzoate 26 is equipotent with cocaine for WIN binding ( $\mathrm{IC}_{50}$ of 193 nM versus 160 nM , respectively) and provided a new lead compound. To further elucidate the structure-activity relationships for binding to the DAT, the synthesis of compounds in which a phenyl ring is directly attached to the bicycle at C-2 or is linked by one or two carbons was undertaken. These homologues will help determine the optimal distance between the nitrogen and the phenyl ring, while allowing us to investigate the effect of removing the ester functionality. All of the molecules synthesized will be tested in vitro for their ability to inhibit the binding of $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 to rat striatal tissue membrane preparations and the uptake of $\left[{ }^{3} \mathrm{H}\right]$ dopamine (DA) into rat striatal synaptosomes. In vitro inhibition of
$\left[{ }^{3} \mathrm{H}\right]$ citalopram binding to the serotonin transporter $(5-\mathrm{HT})$ will also be measured to establish the relative selectivity of the congeners for the various transporters. Results of the SARs will allow for fine tuning of future compounds.

## Chemistry

## 2-Amino-6-phenylbicyclo[2.2.2]octanes

Phenylmagnesium bromide was added to endo-amino ketone 19 at $-20^{\circ} \mathrm{C}$ in ether. GC/MS of crude product showed that only one diastereomer was formed during the reaction. The phenyl reagent was delivered to the least sterically hindered face of the bicycle to give solely the endo-amino-exo-phenyl compound 29. Purification by column chromatography afforded endo-amino-exo-phenyl compound 29. The assignment of the relative stereochemistry was done using 1-D and 2-D nuclear magnetic resonance spectroscopy (Appendix D). Dehydration of 29 with p-TSA gave the unsaturated amine 30, which gave a doublet of doublets at $\delta 6.64 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR spectrum with coupling constants of 6.9 Hz and 1.8 Hz . This is consistent for the vinylic proton at the C3 position on the bicycle, which couples to the bridgehead proton at C-4 with a small dihedral angle and the bridgehead proton at C-1 (i.e., via long-range allylic coupling). Alkene $\mathbf{3 0}$ was hydrogenated to afford a 1:3 mixture of endo- and exo-phenyl amines $\mathbf{3 2}$ and 31, which were separated by column chromatography. The stereochemical assignment of amine $\mathbf{3 1}$ was established using nuclear magnetic spectroscopy and confirmed by x-ray analysis (Appendix E).

Reagents: a) aryl magnesium bromide, ether, - 20 C ; b) p-TSA, toluene, reflux; c) $\mathrm{H}_{2}$, $\mathrm{Pd} / \mathrm{C}, 40 \mathrm{psi}$; and d) $50 \% \mathrm{w} /$ w Rainey $\mathrm{Ni} / \mathrm{H}_{2} \mathrm{O}, \mathrm{H}_{2}, \mathrm{CH}_{3} \mathrm{OH}, 60 \mathrm{psi}$.

Scheme 3.1. Synthesis of 2,6-disubsttuted compounds 30-32 and 39-42.

## 2-Amino-6-benzylbicyclo[2.2.2]octanes

Amino ketone 19 was treated with benzyl magnesium chloride to give a single product by GC/MS, which was assigned as the endo-amino-exo-phenyl alcohol 33. Just like the phenyl grignard mentioned in the paragraph above, the benzyl reagent was delivered to the least sterically hindered face of the bicycle. Since the two benzylic protons are adjacent to a stereocenter, the benzylic protons are diastereotopic and appear as a pair of doublets at $\delta 2.89 \mathrm{ppm}$ and $\delta 2.65 \mathrm{ppm}$ with a coupling constant of 13.8 Hz . The endo-amino-exo-phenyl alcohol $\mathbf{3 3}$ was dehydrated by treatment with p-TSA to give a 9:1 ratio (determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy) of endocyclic unsaturated amine $\mathbf{3 5}$ and a mixture of cis and trans exocyclic alkenes, 37. Without any further purification, this mixture of alkenes was hydrogenated over $\mathrm{Pd} / \mathrm{C}$ to obtain a 10:1 mixture of exo-benzyl-endo-amine 39 and endo-benzyl-endo-amine 41. Since the hydrogenation conditions gave mostly exo- benzyl diastereomer 39, alternate routes were explored to obtain the endo-benzyl amine 41. Some of the methods attempted were: 1) a Barton reductive deoxygenation ${ }^{1}$ of alcohol $\mathbf{3 3}, 2$ ) hydroboration of the mixture of $\mathbf{3 5}$ and $\mathbf{3 7}$ with borane ${ }^{2}$, and 3) hydrogenations of the mixture of $\mathbf{3 5}$ and $\mathbf{3 7}$ with either $\mathrm{Pd} / \mathrm{C}$ or Rainey nickel and different solvents (methanol, ethyl acetate, $\mathrm{H}_{2} \mathrm{O}$, hexane). The hydrogenation with $50 \%$ w/w of Rainey nickel in $\mathrm{H}_{2} \mathrm{O}$ and methanol provided a 50:50 mixture of the endo-benzyl amine 39 and the exo-benzyl amine 41 (determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy, based on the dimethylamine singlet at $\delta 2.10 \mathrm{ppm}$ and $\delta 1.99 \mathrm{ppm}$, respectively). The diastereomers were separated using column chromatography to obtain the two pure diastereomers 39 and 41. The structural assignment of benzyl 39 was done by 1- and 2-dimensional NMR spectroscopy (Appendix F) and based on the differences
in chemical shifts of the benzyl protons in the free amine. (Appendix F). The benzylic protons directly above the dimethylamine, as is the case for endo-benzyl-endo-amine 41, should be shifted further downfield than the corresponding diastereomer, exo-benzyl-endo-amine 39, due to the electrochemical environment being influenced by the electronegative nitrogen.

## 2-Amino-6-phenethylbicyclo[2.2.2]octanes

Addition of phenethylmagnesium bromide to amino ketone 19 in the same manner as the benzyl Grignard, gave the exo-phenethyl-endo amino 34 (determined by GC/MS) and $30 \%$ of the reduced endo-alcohol 21 (determined by GC/MS and ${ }^{1} \mathrm{H}$ NMR spectroscopy). The mixture was dehydrated with p-TSA to give a $3: 1$ mixture (based on the ${ }^{1} \mathrm{H}$ NMR spectrum) of cis and trans exocyclic alkenes 38 and endocyclic alkene 36. The mixture was hydrogenated to obtain a $20: 1$ exo:endo mixture (determined by the ${ }^{1} \mathrm{H}$ NMR spectrum, based on the 6 proton singlet for the dimethylamine at $\delta 2.20 \mathrm{ppm}$ and $\delta$ 2.17 ppm ) of diastereomers exo-phenethyl amine 40 and endo-phenethyl amine 42. Hydrogenation with $50 \%$ w/w Rainey nickel in $\mathrm{H}_{2} \mathrm{O}$ and methanol provided a 60:40 mixture of the exo-phenethyl amine 40 and the endo-benzyl amine 42. The hydrogenation of the phenethyl diastereomers required harsher conditions than the benzyl or phenyl analogs ( 40 psi overnight vs 60 psi for 3 days). The mixture of 40 and $\mathbf{4 2}$ was separated using column chromatography to obtain the two pure diastereomers. The structure of endo-phenethyl-endo-amine 42 was determined by single crystal x-ray diffraction (Appendix G). The two benzylic protons appear at different chemical shifts in the ${ }^{1} \mathrm{H}$ NMR spectrum ( $\delta 2.70 \mathrm{ppm}$ and $\delta 2.58 \mathrm{ppm}$ ), which may be due to the dimethylamine
functionality inhibiting rotation of the benzylic group. In contrast, the two benzylic protons for the exo-phenethyl amino 40 are identical and appear as a doublet of doublets $(10.5 \mathrm{~Hz})$ at $\delta 2.80 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR spectrum.

## Pharmacology

## Inhibition of WIN Binding and $\left[{ }^{3} \mathrm{H}\right]$ DA Uptake.

The phenyl amines, 30-32, were tested to determine the $\mathrm{IC}_{50}$ values for the inhibition of ligand binding to the DAT according to established protocols (Table 3.1). ${ }^{3,4,5}$ The potency of the phenyl amines was increased with excision of the ester when comparing endo-benzoate 10 with endo-arene-endo-amine $32\left(\mathrm{IC}_{50}=21700 \mathrm{nM}\right.$ versus $\mathrm{IC}_{50}=1300 \mathrm{nM}$, respectively). exo-Arene-endo-amine 31 has an $\mathrm{IC}_{50}=20900 \mathrm{nM}$ versus $\mathrm{IC}_{50}=192 \mathrm{nM}$ for compound 26a, which suggests potency was lost by the excision of the ester functionality when the phenyl ring is exo on the bicycle. Preliminary data shows exo-arene-endo-amine 31 to be over 20 -fold selective for the 5 -HT over the DAT. The endo-arene-endo-amine $\mathbf{3 2}$ has an $\mathrm{IC}_{50}$ of 1300 nM , which is more potent by 16 -fold than the exo-arene-endo-amine 31, which has an $\mathrm{IC}_{50}$ of 20900 nM . An unexpected result was the potency of the unsaturated endo-amine 30 with an $\mathrm{IC}_{50}$ of 740 nM , which is similar in potency as the endo-amino-exo-benzoate 26a $\left(\mathrm{IC}_{50}=192 \mathrm{nM}\right)$ and exo-arene-endo-amine $32(1300 \mathrm{nM})$. The potency increases by placing the arene moiety exo or by the increased nitrogen to phenyl distance seen with benzoate 26a. The phenyl ring of the

benzoate may occupy a space similar to the phenyl ring on the unsaturated compound $\mathbf{3 0}$ and arene 32. It will be interesting to determine the pharmacological data on the benzyl and phenethyl analogs of $\mathbf{3 1}$, to investigate the increased length between the nitrogen and the phenyl ring.

## Conclusions

A series of 6-( $N, N$-dimethylamino)-2-benzylbicyclo[2.2.2]octanes was prepared by Grignard addition to amino ketone 19. Comparison of the WIN binding of benzoate ester 26a, with an $\mathrm{IC}_{50}$ of 192 nM vs phenyl analog 31, with an $\mathrm{IC}_{50}$ of 1300 nM , shows the potency was lost by the excision of the ester. Preliminary data shows exo-arene-endoamine $\mathbf{3 1}$ to be over 20 -fold selective for the $5-\mathrm{HT}$ over the DAT. The endo-arene-endoamine $\mathbf{3 2}$ is more potent by 16 -fold at the DAT than the exo-arene-endo-amine $\mathbf{3 1}\left(\mathrm{IC}_{50}=\right.$ 1300 nM vs $\mathrm{IC}_{50}=20900 \mathrm{nM}$, respectively) and more potent by 16 -fold than the endo-amino-endo-benzoate $10\left(\mathrm{IC}_{50}=1300 \mathrm{nM}\right.$ vs $\left.\mathrm{IC}_{50}=21700 \mathrm{nM}\right)$. The potency of unsaturated endo-amine 30, with an $\mathrm{IC}_{50}$ of 740 nM , is similar to that of the endo-amino-exo-benzoate 26a $\left(\mathrm{IC}_{50}=192 \mathrm{nM}\right)$ and endo-amine-endo-arene $32\left(\mathrm{IC}_{50}=1300 \mathrm{nM}\right)$. The tether of the benzoate ester may allow the phenyl ring to fit in a similar binding space as the phenyl ring on the unsaturated compound $\mathbf{3 0}$. It will be interesting to obtain the pharmacological data on the benzyl and phenethyl analogs of 31, as these arenes have an increased length between the nitrogen and the phenyl ring. These homologues will help determine the optimal distance needed between the nitrogen and the phenyl ring.

## Experimental Section

General Methods. The general methods can be found in the experimental section of Chapter 2.

## 6-endo-(N,N,-Dimethylamino-2-exo-phenylbicyclo[2.2.2]octan-endo-2-ol (29).

A solution of 3 M phenylmagnesium bromide in ether $(4.08 \mathrm{~mL}, 11.98 \mathrm{mmol})$ at $-20^{\circ} \mathrm{C}$ was added dropwise a solution of amino ketone 19 ( $500 \mathrm{mg}, 2.99 \mathrm{mmol}$ ) in ether (100 $\mathrm{mL})$. The mixture was stirred for $4 \mathrm{~h}, \mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ was added, and solvent was removed by reduced pressure. The aqueous layer was made acidic with 1 M HCl , washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{~mL})$, and then made basic with NaOH pellets, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3 x 100 mL ). The organic extracts were combined, dried over $\mathrm{MgSO}_{4}$, and the solvent was removed under reduced pressure to afford 550 mg of crude endo-amino alcohol 29. Purification by column chromatography (5:1 methanol:chloroform as the eluant) afforded endo-alcohol-endo-amine $29\left(\mathrm{R}_{\mathrm{f}}=0.40,400 \mathrm{mg}, 54 \%\right.$ yield $)$ as a white crystalline solid. mp 53-56 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.25-1.29(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}-7 \mathrm{exo}), 1.37-1.42(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}-8)$, 1.43-1.55 (m, 2H, C-7 endo, C-8), 1.81 (qt, J=13.2, 7.5, 1.8, $1.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-5$ endo), 1.92 (dddd, $J=13.2,9.3,3.9,2.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-5$ exo), 2.00 (dt, $J=14,2.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3 \mathrm{endo}$ ), 2.022.06 (m, 1H, C-4) 2.12-2.15 (m 1H, C-1), 2.28 (ddd, $J=9.0,7.2,1.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-6), 2.31-$ $2.41\left(\mathrm{~m}, 7 \mathrm{H}, \mathrm{C}-3\right.$ exo, $\left.\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 7.24\left(\mathrm{tt}, J=7.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Ar}_{4}\right), 7.36(\mathrm{tt}, J=7.5,1.5 \mathrm{~Hz}$, $\left.2 \mathrm{H}, \mathrm{Ar}_{2,6}\right), 7.60\left(\mathrm{dt}, J=8.0,1.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ar}_{3,5}\right) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 21.07,23.10,26.11$, (aryl).

## CHAPTER IV

## SYNTHESIS OF 5-AMINO-2-BENZOYLBICYCLO[2.2.2]OCTANES

## Introduction

Another approach taken to further understand the role of the phenyl ring on the 6-amino-[2.2.2]bicyclo -2-benzoates (10-28, Chapter 3) was to transpose the benzoate from the C-2 position on the bicycle to the C-3 position. This places the benzoate one carbon over on the same bridge, e.g. compounds 55-58. The transposition of the benzoate one carbon over increases the length between the nitrogen and the phenyl ring, which should influence the binding of the inhibitor at the DAT. Thus, extensive analysis of the structural changes will allow for the development of SARs related to the fit of these compounds at the active site of the DAT.

## Chemistry

The transposition of the ester functionality from the $\mathrm{C}-2$ position to the $\mathrm{C}-3$ position was achieved employing a new synthetic strategy shown in Scheme 4.1. DielsAlder reaction between hydroquinone and maleic anhydride provided the cycloaddition

Scheme 4.1. Synthesis of 2-Amino-5-benzylbicyclo[2.2.2]octanes 55-58.
adduct 43 in low yield (5-11\%). ${ }^{1}$ The product was purified by triturating the crude product with a 3:7 mixture of boiling ethyl acetate and diethyl ether. Although the reaction proceeded in low yield, the starting materials are cheap and the purification is trivial. The anhydride 43 was hydrolyzed to the cis diacid 44 by heating in $\mathrm{H}_{2} \mathrm{O}$. The diacid 44 was oxidatively decarboxylated with lead tetraacetate to form the enedione 44. The ${ }^{1} \mathrm{H}$ NMR spectrum of enedione 45 shows a peak at $\delta 6.56$, which integrates to 2 Hs which can be assigned to the two vinylic protons. Enedione $\mathbf{4 5}$ was ketalized with an equimolar quantity of ethylene glycol to give a mixture of diacetal, acetal, and starting material. ${ }^{2}$ Hydrogenation of the mixture gave a 6:71:23 ratio of diacetal, acetal 46, and starting material (determined by ${ }^{1} \mathrm{H}$ NMR). The mixture was purified by column chromatography using a 1:1 hexane:ether eluant. The starting material could be recovered directly from the column and by hydrolysis of the diacetal. The monoacetal 46 was reductively aminated with dimethylamine hydrochloride to afford a 5:1 mixture of the endo:exo diastereomeric amino acetals 47 and 48 (determined by ${ }^{1} \mathrm{H}$ NMR, based on the appearance of the 6 H proton singlet for the dimethylamino group at $\delta 2.19 \mathrm{ppm}$ and $\delta$ 2.20 ppm ), which were separated by column chromatography on alumina with chloroform as the eluant. The separate amino acetals were deprotected with 1 M HCl and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give the corresponding amino ketones $\mathbf{4 9}$ and $\mathbf{5 0}$. The amino ketones were then reduced to afford a 3:2 ratio of endo-amino alcohols 51 and $\mathbf{5 2}$ and a 1:1 ratio of exoamino alcohols $\mathbf{5 3}$ and 54, respectively. The structure of endo-amino alcohol $\mathbf{5 2}$ was determined by x-ray diffraction (Appendix H). The amino alcohols $\mathbf{5 1 - 5 4}$ were purified by column chromatography. The hydroxy amines 52 and 54 were benzoylated to afford the corresponding benzoates $\mathbf{5 6}$ and 58, and benzoates 55 and 57 were obtained by

Mitsunobu chemistry of hydroxy amines $\mathbf{5 2}$ and $\mathbf{5 4}$. The structure of benzoate $\mathbf{5 7}$ was confirmed by x-ray analysis (Appendix I).

## Pharmacology

Benzoates 55-58 were submitted for pharmacological testing and the results are pending.

## Conclusions

A series of new regioisomers, benzoates 55-58, were synthesized using DielsAlder chemistry to construct the bicycle. The bicycle was formed by reacting hydroquinone with maleic anhydride. This strategically places ketones at the C-2 and C-5 position of the bicyclooctane skeleton. This was used to introduce a benzoate and an amine moiety. The transposition of the benzoate relative to the 6 -amino-[2.2.2]bicyclo-2benzoates (10-28) lengthens the distance between the nitrogen and phenyl, and as a result, will provide more insight into the active site of the DAT. While the pharmacology data is still pending for benzoates $\mathbf{5 5 - 5 8}$, the new substitution pattern on the bicycle, with the amine at C-2 and the benzoate at C-5, will allow for a direct comparison with regioisomers 10-28, whose synthesis is described in Chapter 2.

## Experimental Section

General Methods. The general methods can be found in the experimental section of Chapter 2.

5,7-Dioxo bicyclo[2.2.2]octane-2,3-dicarboxylic anhydride (43). Maleic anhydride ( $500 \mathrm{~g}, 5.1 \mathrm{~mol}$ ) was heated to $130^{\circ} \mathrm{C}$ and hydroquinone ( $321 \mathrm{~g}, 2.9 \mathrm{~mol}$ ) was added to the flask. The mixture was then heated to $190^{\circ} \mathrm{C}$ for 6 h , cooled to $60{ }^{\circ} \mathrm{C}$, and a mixture of ethyl acetate ( 300 mL ) and diethyl ether $(700 \mathrm{~mL})$ was added to the flask. The mixture was heated at reflux for 30 min and 57 g of the insoluble anhydride 43 was isolated by filtration ( $11.5 \%$ yield, mp 252-256 ${ }^{\circ} \mathrm{C}$, lit mp 265-270 ${ }^{\circ} \mathrm{C}$ ). ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}$ ): $\delta 2.35$ (dd, $J=20.1,3.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-6$ endo), 2.68 (dd, $J=19.2,2.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-$ 8), 2.77 (dd, $J=19.2,3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-8), 2.80(\mathrm{dt}, J=20.4,2.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-6 \mathrm{exo}), 2.98$ (q) $J=$ $3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-1), 3.01(\mathrm{q}, J=3.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-4), 3.80(\mathrm{ddd}, J=10.2,3.6,2.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-2)$, 3.96 (dd, $J=10.2,3.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3) .{ }^{13} \mathrm{C}\left(\mathrm{DMSO}_{\mathrm{d}}^{6}\right): ~ \delta 36.90,37.54,40.72,42.97,44.98$, 46.92, 171.40, 171.48, 206.11, 207.02.

5,7-Dioxo bicyclo[2.2.2]octane-2,3-dicarboxylic acid (44). The cis diacid 44 was obtained by recrystallizing the anhydride ( 58 g ) from $\mathrm{H}_{2} \mathrm{O}$ ( $100 \%$ yield). mp: 262$265^{\circ} \mathrm{C}$, lit mp 264-266 ${ }^{\circ}{ }^{1} \mathrm{H}$ NMR (DMSO- $d_{6}$ ): $\delta$ 2.35-2.49 (m, 2H), 2.66-2.87 (m, 4H), $3.34(\mathrm{dd}, J=11.1,1.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-2), 3.45(\mathrm{dd}, J=11.1,2.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3) .{ }^{13} \mathrm{C}\left(\mathrm{DMSO}-d_{6}\right)$ : $\delta 36.11,38.11,39.77,43.76,45.98,47.98,172.08,173.98,208.40,208.94$.

Bicyclo[2.2.2]oct-7-ene-2,5-dione (45). Pyridine ( $568 \mathrm{~mL}, 7.0 \mathrm{~mol}$ ) was added dropwise to a mixture of diacid $44(63.2 \mathrm{~g}, 0.280 \mathrm{~mol})$ and lead tetraacetate $(282.2 \mathrm{~g}$, $0.636 \mathrm{~mol})$ in dioxane $(\mathrm{mL})$ at $0^{\circ} \mathrm{C}$. The mixture was then heated to $60^{\circ} \mathrm{C}$ for min, cooled, and $2 \mathrm{M} \mathrm{HNO}_{3}(2000 \mathrm{~mL})$ was added. The mixture was extracted with chloroform ( $2000 \mathrm{~mL} \times 3$ ), the organic extracts were combined and washed with saturated NaHCO 3 ( 500 mL x 1), dried over $\mathrm{MgSO}_{4}$, and the solvent was removed under reduced pressure to obtain 8 g of crude product. Pure product ( $4.3 \mathrm{~g}, 11.2 \%$ yield) was obtained by flash column chromatography ( $20 \%$ ethyl acetate/ PET ether, $\mathrm{R}_{\mathrm{f}}=0.55$ ) as a pale brown solid. $\mathrm{mp} 101-105{ }^{\circ} \mathrm{C}$ lit $\mathrm{mp} 95-99^{\circ} \mathrm{C}^{1} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 2.33$ (dd, $J=18.6$, $2.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}-3, \mathrm{C}-5), 2.43$ (dd, $J=18.6,2.1 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}-3, \mathrm{C}-5), 3.43-3.47$ (m, 2H, C-1, C4), 6.50-6.56 (m, 2H, C-7, C-8). ${ }^{13} \mathrm{C}\left(\mathrm{CDCl}_{3}\right): \delta 34.89,49.76,132.06,207.50$.

5-(Ethylenedioxy)bicyclo[2.2.2]octan-2-one (46). A mixture of dione 45 (4.28 g, $31 \mathrm{mmol})$, p-toluene sulfonic acid ( $300 \mathrm{mg}, 1.58 \mathrm{mmol}$ ), and ethylene glycol ( $1.12 \mathrm{~g}, 31$ mmol ) in 70 mL of benzene was heated to reflux for 1 h . The mixture was cooled and $5 \%$ NaOH was added to the mixture. The solution was stirred for 4 hours and the solvent removed under reduced pressure. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100$ mL ), the organic extracts were collected, dried over $\mathrm{MgSO}_{4}$, and the solvent was removed by reduced pressure to obtain 5.4 g of crude product. The crude acetal was dissolved in methanol $(50 \mathrm{~mL}), \mathrm{Pd} / \mathrm{C}$ catalyst was added, and the mixture was stirred overnight, under 40 psi. The mixture was filtered through celite, and the solvent removed under reduced pressure to obtain 5.3 g of crude product. The acetal 46 ( $3.65 \mathrm{~g}, 63 \%$ yield, $R f=0.40)$ ) was obtained by flash column chromatography (1:1 hexane:ether) as a
colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.43-1.55(\mathrm{~m}, 1 \mathrm{H}), 1.65-1.84(\mathrm{~m}, 2 \mathrm{H}), 1.93-2.14(\mathrm{~m}$, $5 \mathrm{H}), 2.34(\mathrm{p}, J=3 \mathrm{~Hz}, 1 \mathrm{H}), 2.51(\mathrm{dt}, J=19.5,3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3), 3.80-3.97(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ $\left(\mathrm{CDCl}_{3}\right): \delta 20.35,20.99,36.27,38.64,40.31,44.27,64.02,64.35,109.02(\mathrm{OCO}), 215.14$ ( $\mathrm{C}=\mathrm{O}$ ).

2-(N,N-Dimethylamino)-5-(ethylenedioxy)bicyclo[2.2.2]octanes (47 and 48). A mixture of ketone $65(3.4 \mathrm{~g}, 18.6 \mathrm{mmol})$, dimethylamine hydrochloride $(9.1 \mathrm{~g}, 112$ mmol ), triethylamine ( $22.6 \mathrm{~g}, 223 \mathrm{mmol}$ ), and $4 \AA$ molecular sieves ( 70 g ) in 200 mL of methanol was stirred overnight, followed by the addition of $\mathrm{Pd} / \mathrm{C}$ catalyst and $\mathrm{H}_{2}$ ( 40 psi ). The mixture was stirred for 3 d , filtered through celite, and the solvent removed under reduced pressure to obtain 3.7 g of crude product ( $89 \%$ yield). The diastereomers were separated by flash column chromatography (alumina, chloroform) to obtain 1.68 g of endo-amine $47(41.1 \%$ yield, $\mathrm{Rf}=0.40)$ as a colorless oil and 0.367 g of exo-amine 48 ( $9 \%$ yield, $\mathrm{Rf}=0.45$ ) as a pale yellow solid.

2-endo-(N,N-Dimethylamino)-5-(ethylenedioxy)bicyclo[2.2.2]octane (47). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.36(\mathrm{dddd}, J=12.3,8.7,5.1,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.43(\mathrm{dq}, J=11.1,3 \mathrm{~Hz}, 1 \mathrm{H}$, C-3endo), 1.55-1.86 (m, 7H), 1.99 (sextet, $J=2.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-1$ ), 2.12 (dt, $J=14.4,2.1 \mathrm{~Hz}$, 1H, C-6), $2.19\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 3.79-3.99(\mathrm{~m}, 4 \mathrm{H}, \mathrm{C}-9, \mathrm{C}-10) .{ }^{13} \mathrm{C}\left(\mathrm{CDCl}_{3}\right): \delta 20.50$, $24.02,28.79,30.47,33.34,35.07,43.78,63.49,63.79,63.91,110.10$ (C-5).

## CHAPTER V

## SYNTHESIS OF AMINO BENZOYLBICYCLO[2.2.1]HEPTANES

## Introduction

In contrast to the previous chapters which describe synthesis for [2.2.2]bicyclooctanes, the work described in Chapter V involves the synthesis of disubstituted bicyclo[2.2.1]heptanes that are substituted at the C-2 and C-7 position of the bicycle (amino benzoates $\mathbf{6 6 - 6 7}$, Figure 5.2). The substitution at the C-7 position provides compounds which places substituents at a position which is between carbon atom 2 and 3 in the [2.2.2]octanes, discussed in Chapters 2 and 4 (Figure 5.1). One can imagine the one-carbon bridge occupying a position so as to orient the phenyl substituent in an orientation between that occupied in the 2,5 and 2,6 disubstituted [2.2.2]octanes. By placing the benzoate on the one-carbon bridge and the dimethyl amine at the $\mathrm{C}-2$ position of the bicycle, a direct comparison can be completed by comparing the pharmacology data with the compounds previously synthesized. The positions of the benzoate can be reversed to give benzoate 67 , which provides an arrangement of substituents that closely resembles the relative position of the nitrogen and arene cocaine. Exploring these analogs

will provide us a better understanding of the necessary spatial arrangement, which the active site of the DAT can accommodate.

## Chemistry

A synthetic route, which strategically placed alcohol groups on the one- and twocarbon bridges of the disubstituted bicyclo[2.2.1]heptanes is shown in Figure 6.2.

Epoxynorbornane was subjected to an acid-catalyzed Wagner-Meerwein rearrangement using perchloric acid to obtain the syn diol product $\mathbf{6 0}$, which was purified by column chromatography. ${ }^{1}$ The ${ }^{1} \mathrm{H}$ NMR spectrum $\left(\mathrm{D}_{2} \mathrm{O}\right)$ shows two peaks at $\delta 3.84$ and 3.70 ppm
for the protons at C-7 and C-2. The stereochemistry of diol $\mathbf{6 0}$ was determined using 2-D ${ }^{1}$ H NMR spectroscopy and is consistent with the syn diol 60 (Appendix J). The syn diol 60 was benzoylated using an equimolar amount of benzoyl chloride to afford a mixture of benzoate 61, benzoate 62, and dibenzoylated $\mathbf{6 3}$ product in a 1:1:1 ratio (determined by ${ }^{1}$ H NMR spectroscopy). The ${ }^{1} \mathrm{H}$ NMR spectrum shows a singlet at $\delta 5.08 \mathrm{ppm}$ for the proton alpha to the benzoate for $\mathbf{6 2}$ and a multiplet at $\delta 5.03 \mathrm{ppm}$ for benzoate 61. A doublet of doublets at $\delta 3.92 \mathrm{ppm}$ was assigned to the carbinol proton of alcohol $\mathbf{6 2}$ and a singlet at $\delta 4.05 \mathrm{ppm}$ was assigned to the carbinol proton of alcohol $\mathbf{6 1}$. The crude mixture was treated with DMSO and oxalyl chloride in a Swern oxidation to give a 1:1 mixture of keto esters $\mathbf{6 4}$ and 65 , which were separated by column chromatography. The structure assignment of keto ester $\mathbf{6 4}$ was completed by ${ }^{1} \mathrm{H}$ NMR spectroscopy (Appendix K). Keto ester $\mathbf{6 4}$ was reductively aminated with dimethylamine (using $\mathrm{H}_{2}$ and Pd over carbon as the catalyst) to obtain amino benzoate $\mathbf{6 6}$. The benzoate at the C-2 position of 64 sterically hinders the syn addition of hydrogen to the endo face of the bicycle, thereby only allowing hydrogenation of the exo face. When sodium cyanoborohydride was used as the reducing agent a 3:2 mixture of keto esters $\mathbf{6 6}$ and $\mathbf{6 7}$ was obtained. Keto benzoate 65 was reductively aminated under these conditions to give a $10: 1$ mixture of keto esters 68 and 69. Analytically pure samples of keto esters 66-69 were obtained by column chromatography. The structure assignments of amino benzoates $\mathbf{6 6}$ and $\mathbf{6 8}$ were completed by x-ray analysis (Appendix L and M).

The approach used to synthesize amino norboranyl benzoates (73 and 74) is shown in Figure 6.3. Diol $\mathbf{6 0}$ was treated with triphenyl phosphine, benzoic acid, and diethylazodicarboxylate (DEAD) in a Mitsunobu reaction in an effort to invert the
stereochemistry at the C-2 and C-7 positions while placing a benzoate directly on the bicycle. A 2:1:1:2 mixture (determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy) of benzoates 70, 71, 61, 62, and dibenzoates was obtained and separated by column chromatography. For benzoate 70, a doublet of triplets at $\delta 5.63 \mathrm{ppm}$ and a doublet at $\delta 4.25$ were assigned to the proton $\alpha$ to the benzoate and to the carbinol proton, respectively. Benzoate 70 was treated with DMSO and oxalyl chloride in a Swern oxidation to give keto ester 72. The ${ }^{1}$ H NMR spectrum of 72 has a doublet for the carbinol proton at $\delta 4.25$ and a doublet of doublet of doublet of doublets for the proton $\alpha$ to the benzoate to $\delta 5.40 \mathrm{ppm}$. Keto ester 72 was reductively aminated using sodium cyanoborohydride to obtain amino benzoates 73 and 74, which were separated by column chromatography. The relative stereochemical assignment of benzoates $\mathbf{7 3}$ and $\mathbf{7 4}$ was completed (Appendix P)

## Pharmacology

Benzoates 66-69 and 73-74 were submitted for pharmacological testing and the results are pending.

## Conclusions

A series of new [2.2.1]bicycloheptanes, benzoates 66-69 and 73-74, were synthesized using epoxynorbornane as the scaffold. The bicycle undergoes a nonclassical carbocation rearrangement to form a syn diol. This strategically places an oxygen substituent at the C-2 and C-7 position of the bicycloheptane skeleton. This was used to introduce a benzoate and an amine moiety. The benzoate and amine substituents were exchanged so as to place the nitrogen on the one-carbon bridge in one set of regioisomers with the benzoate at the C-2 position. In the other set of regioisomers the nitrogen is placed at the C-2 position and the benzoate on the one-carbon bridge. The pharmacology data is still pending for benzoates 66-69 and 73-74. The new substitution pattern on the bicycle, with the amine at $\mathrm{C}-2$ or $\mathrm{C}-7$ and the benzoate at $\mathrm{C}-2$ or $\mathrm{C}-7$, will allow for a direct comparison with other benzoates synthesized.

## Experimental Section

General Methods. The general methods can be found in the experimental section of Chapter 2.

2-endo-7-exo-bicyclo[2.2.1]heptane diol (60). A catalytic amount of perchloric acid (2 drops) was added to a stirred solution of exo epoxy norbornane ( $25 \mathrm{~g}, 0.227 \mathrm{~mol}$ ) in $\mathrm{H}_{2} \mathrm{O}(150 \mathrm{~mL})$. The mixture was heated to $60^{\circ} \mathrm{C}$ for 20 min , cooled to room temperature, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 150 \mathrm{~mL})$. The combined extracts were dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent was removed under reduced pressure to afford the crude product ( 22 g ). The final product was obtained by column chromatography (silica, 1:1 ethyl acetate:hexane, $\left.\mathrm{R}_{\mathrm{f}}=0.44\right)$ as a white solid $(15 \mathrm{~g}, 53 \%$ yield $) \mathrm{mp} 168.5-170.5^{\circ} \mathrm{C}$, lit. 179.5-181 ${ }^{\circ} \mathrm{C}^{2} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{D}_{2} \mathrm{O}$ ): $\delta 0.79-0.91$ ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{C}-6 \mathrm{endo}, \mathrm{C}-7 \mathrm{endo}$ ), 1.23-1.46 (m, 2H, C-6exo, C-7exo), 1.59-1.64 (dm, $J=13.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3 \mathrm{exo}), 1.71-1.78(\mathrm{dd}, J=$ $13.8,7.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3 \mathrm{endo}$ ), 1.90 (d, $J=3.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-1$ ), 1.99 (br s, $1 \mathrm{H}, \mathrm{C}-4$ ), 3.70 (br d, $J=6.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-2 \mathrm{endo}), 3.84(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-5) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right): \delta 21.72,24.84,38.77$, 40.29, 46.23, 75.76, 79.89.

Benzoylbicyclo[2.2.1]heptanol (61 and 62). Diol 60 ( $5.9 \mathrm{~g}, 46 \mathrm{mmol}$ ) was added to a stirred solution of benzoyl chloride ( $5.35 \mathrm{~mL}, 46.1 \mathrm{mmol}$ ), pyridine $(11.52 \mathrm{~mL}, 92.2$ mmol), and DMAP ( $60 \mathrm{mg}, 0.49 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$. The mixture was stirred overnight at room temperature and $\mathrm{H}_{2} \mathrm{O}(\mathrm{mL})$ was added. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{~mL})$, the organic extracts were combined, dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent removed under reduced pressure to afford 9.9 g of a mixture of benzoates 61 and 62, dibenzoate 63, and diol 60 in a 25:51:23:1 ratio. Recrystallization of the mixture from ethyl acetate:hexane gave benzoate $\mathbf{6 2}$ as colorless solid (1.2 g, 34\% yield).The solvent was removed from the mother liquor and chromatographed (silica gel, 1:1 ethyl acetate:hexane eluant) to obtain dibenzoate ( 2.5 g ), benzoate $\mathbf{6 1}(3.3 \mathrm{~g}, 46 \%$ yield, $\left.\mathrm{R}_{\mathrm{f}}=0.55\right)$ as a yellow oil and benzoate $62\left(0.520 \mathrm{~g}, 14 \%\right.$ yield, $\left.\mathrm{R}_{\mathrm{f}}=0.52\right)$ as a white solid. The crude mixture of benzoates and dibenzoate can be used without further purification.

## CHAPTER VI

# SYNTHESIS OF 2-BENZOYL-5-(( $N, N$-DIMETHYLAMINO)METHYL)-6PHENYL[2.2.1]BICYCLOHEPTANES 

## Introduction

Work previously pursued in our group on 2-substituted-6-amino-5phenylbicyclo[2.2.2]octanes ${ }^{1}$ showed that the incorporation of an oxygen functionality at the C-2 position of the bicycle has the following trends: endo-benzoate-endo-amine $\mathbf{6}$ was more potent than the endo-alcohol-endo-amine, which was more potent than the C-2 ketone (Figure 6.1). The incorporation of the benzoyl ester enhanced the potency of these compounds. In another set of experiments previously completed in our group, ${ }^{2}$ amines 16 and $\mathbf{1 7}$ were synthesized. Both compounds contain a trans stereochemical arrangement at C-2 and C-3 with the only difference being the amino methyl substituent is endo in amine 16 and exo in amine 17. Amines $\mathbf{1 6}$ and $\mathbf{1 7}$ were of interest because of the difference in the inhibitor potency in $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 (WIN) binding at the DAT. This relatively minor variation in structure leads to a large difference in potency. The $\mathrm{IC}_{50}$ for the trans endo-amine 16 is 515 nM , whereas the trans exo-amine 17 is 2510 nM , a 5-fold increase. The work described in this chapter allows for the determination of the effect of incorporating a benzoate onto the [2.2.1]bicyclic scaffold of amines $\mathbf{1 6}$ and $\mathbf{1 7}$. In
addition, the 4-chlorobenzoate analogs were synthesized since it is known that the incorporation of a halogen on the phenyl ring generally increases the potency relative to the unsubstituted phenyl compound. ${ }^{2}$ The $\left[{ }^{3} \mathrm{H}\right]$ WIN 35,428 binding and DA uptake will indicate the importance of each benzoate and the 4-chlorophenyl at the C-2 position of the [2.2.1]bicycloheptane.

## Chemistry

An attractive route which places a ketone on the unsubstituted two-carbon bridge of 2-amino-3-phenylbicyclo[2.2.1]heptanes is shown in Figure 6.2. A double-Michael addition of tert-butyl acrylate to 2-cyclopentenone provides the trans bicyclic ketone 77. ${ }^{3}$ The appearance of a doublet at $\delta 3.51 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR spectrum of 77 with a coupling constant of 5.1 Hz for the proton $\alpha$ to the phenyl is consistent with retention of the trans stereochemical arrangement. The $t$-butyl ester 77 was hydrolyzed to the carboxylic acid by treatment with trifluoroacetic acid. A complete structure assignment of acid 78 was completed (Appendix N). Acid 78 was converted to an acid chloride with oxalyl chloride (79, monitored by the appearance of peaks in the IR at 1796 and $1757 \mathrm{~cm}^{-}$ ${ }^{1}$ ), aminated with dimethylamine, and recrystallized from ethyl acetate to give amide $\mathbf{8 0}$. The ${ }^{1} \mathrm{H}$ NMR spectrum shows two singlets at $\delta 3.06 \mathrm{ppm}$ and $\delta 2.97 \mathrm{ppm}$ that integrate to 3 protons each for the dimethyl amide moiety. Amide $\mathbf{8 0}$ was reduced with borane to provide exclusively the endo-hydroxy amine $\mathbf{8 1}$. The hydride was delivered to the least sterically hindered face of the bicycle to provide only the endo- alcohol 81. The ${ }^{1} \mathrm{H}$ NMR spectrum has a peak at $\delta 4.32 \mathrm{ppm}$ which we assign to the carbinol proton at $\mathrm{C}-2$. The multiplicity, a doublet of triplets, is consistent with a proton in an exo position which couples with the exo proton at $\mathrm{C}-3$ with a large coupling constant ( 10.5 Hz ), couples to the endo proton at C-3 $(4.2 \mathrm{~Hz})$, and couples to the bridgehead proton at $\mathrm{C}-1(4.2 \mathrm{~Hz})$. The borate salt of the amine was formed during the reduction of amide $\mathbf{8 0}$ to amine $\mathbf{8 1}$ but was not cleaved during the acidic work-up. The synthesis was continued with the borate salt. Treatment of the endo-hydroxy amine $\mathbf{8 1}$ with the appropriate benzoyl

Reagents: a) LDA, THF, $-78{ }^{\circ} \mathrm{C}$; b) TFA; c) oxalyl chloride, DMF, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; d) $\mathrm{NH}\left(\mathrm{CH}_{3}\right)_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, e) $\mathrm{BH}_{3}$, THF, $-78{ }^{\circ} \mathrm{C}$; f) benzoic acid, DEAD, $\mathrm{PPh}_{3}$, THF; and g) $\mathrm{BnCl}, \mathrm{Et}_{3} \mathrm{~N}$, DMAP, $\mathrm{C}_{6} \mathrm{H}_{6}$.

Figure 6.1. Synthesis of Trisubstitituted [2.2.1]bicycles 86-89.
chloride gave the corresponding benzoates ( $\mathbf{8 2}$ and $\mathbf{8 3}$ ). The structure of benzoate $\mathbf{8 2}$ was resolved by x-ray analysis (Appendix O). Hydrolysis of the borate salts with a 3:1 acetone: 1 M HCl mixture gave the corresponding free amines $(\mathbf{8 6 - 8 7})$. The exo-benzoate 84 and 4 -chlorobenzoate $\mathbf{8 5}$ were obtained by Mitsunobu chemistry, using triphenylphosphine, diethylazodicarboxylate (DEAD), and benzoic acid or 4chlorobenzoic acid. The final products, benzoates $\mathbf{8 8}$ and $\mathbf{8 9}$, were purified by flash column chromatography.

## Pharmacology

Benzoates 86-89 were submitted for pharmacological testing. Results are still pending.

## Conclusions

Preliminary investigations in our group on 2-substituted-6-amino-5phenylbicyclo[2.2.2]octanes ${ }^{1}$ showed that the incorporation of a benzoate onto the [2.2.2]bicyclooctane increased the binding interaction at the DAT (Figure 6.1).

Exploration on 2,3-disubstituted [2.2.1]bicycloheptanes pursued previously in our group ${ }^{2}$ provided amines 16 and 17, which were synthesized in an effort to further evaluate structure-activity relationships that probe the active site of the DAT. In pursuit of the most potent of these two amines, 16, and utilizing the trend seen with the [2.2.2]bicyclooctanes, we incorporated a benzoyl ester onto the [2.2.1]bicycloheptane core. The approach we took involved synthesizing a series of trisubstituted [2.2.1]bicycloheptanes by double-Michael addition of tert-butyl acrylate and cyclopentenone. Based on the mechanism of the addition, only one product is obtained,
the trans ketone 77. This gave the same stereochemistry as in amine $\mathbf{1 6}$ at the C-5 and C6 stereocenters. Through a series of simple functional group interconversions, the endo and exo benzoates and 4-chlorobenzoates were obtained. The pharmacology results for benzoates 86-89 are still pending.

## Experimental Section

General Methods. The general methods can be found in the experimental section of Chapter 2.

## 5-endo-tert-Butoxycarbonyl- 6-exo-phenyl[2.2.1]bicyclohept-2-one (77). 2-

 cyclopentenone $(4.08 \mathrm{~mL}, 48.8 \mathrm{mmol})$ was added to a cooled $\left(-78^{\circ} \mathrm{C}\right)$ stirred solution of lithium diisopropyl amide ( $1.8 \mathrm{M}, 36.6 \mathrm{~mL}, 65.9 \mathrm{mmol}$ ) in 150 mL of anhydrous THF. The solution was stirred at $-78^{\circ} \mathrm{C}$ for 1.5 h , and tert-butyl phenyl acrylate ( $4.98 \mathrm{~mL}, 24.4$ mmol) was added. The reaction mixture was warmed to room temperature and stirred overnight. Distilled water ( 50 mL ) was added to the reaction mixture and the THF was removed under reduced pressure. The residual aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 75 \mathrm{~mL}$ ), the organic extracts were combined and dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent removed under reduced pressure to afford crude product ( $8.84 \mathrm{~g}, 100 \%$ yield). The crude product was dissolved in 50 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the solution was passed through a plug of silica gel to obtain 6.52 g of a light brown solid ( $94 \%$ yield). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.45(\mathrm{~s}, 9 \mathrm{H}, t$-butyl), 1.86 (dd, $J=10.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-7), 2.10-2.21(\mathrm{~m}, 3 \mathrm{H}, \mathrm{C}-$ 3, C-7), 2.84 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{C}-4$ ), $3.02-3.11$ (m, 2H, C-1, C-6), 3.51 (d, $J=5.1,1 \mathrm{H}, \mathrm{C}-5$ ), 7.207.35 (m, 5H, Ar). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 28.07,36.91,39.82,40.01,43.50 .54 .55,56.53$, 81.20 (aliphatic), $126.63,126.92,128.73,142.43,172.05,214.90(\mathrm{C}=\mathrm{O})$.5-endo-Carboxyl- 6-exo-phenyl[2.2.1]bicyclohept-2-one (78). A mixture of keto ester $77(6.52 \mathrm{~g}, 22.8 \mathrm{mmol})$ and trifluoroacetic acid ( $17 \mathrm{~mL}, 220 \mathrm{mmol}$ ) was stirred
for 2 d . The TFA was removed under reduced pressure to obtain crude product ( 6.35 g , $100 \%$ yield). The brown crude product was recrystallized from a 9:1 mixture of hexane:benzene to obtain $\mathbf{7 8}$ as a white crystalline solid. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.92(\mathrm{~d}$, $J=10.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-7), 2.14-2.32(\mathrm{~m}, 3 \mathrm{H}, \mathrm{C}-3, \mathrm{C}-7), 2.90(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-4), 3.16(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-1)$, $3.25(\mathrm{t}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-6), 3.53(\mathrm{~d}, J=5.7,1 \mathrm{H}, \mathrm{C}-5), 7.20-7.37(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ar}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 37.04,39.79,40.25,43.65,53.33,56.43$ (aliphatic), 126.81, 126.99, 128.89, 141.46, 178.88, $215.56(\mathrm{C}=\mathrm{O}) . \mathrm{IR} \mathrm{cm}^{-1}$ (neat): 3434, 1749, 1709.

## 5-endo-Carbonyl chloride- 6-exo-phenyl[2.2.1]bicyclohept-2-one (79). Oxalyl

 chloride ( $4.83 \mathrm{~mL}, 55.2 \mathrm{mmol}$ ) and two drops of dimethylformamide was added to a mixture of acid $78(6.35 \mathrm{~g}, 27.6 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(150 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. To was added. The reaction mixture was stirred for 4 h and the solvent was removed under reduced pressure to give 5.72 g of crude product ( $84 \%$ yield) which was used without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.11$ (dddd, $\left.J=15.9,11.4,4.8,2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-8 \mathrm{endo}\right), 1.25-1.38(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{C}-7 \mathrm{endo}, \mathrm{C}-5 \mathrm{exo}) 1.49$ (dddd, $J=15.9,9.9,5.4,3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-8 \mathrm{exo}$ ), 1.61 (septet, $J=3$ Hz, 1H, C-4), 1.66 (ddd, $J=13.8,9.6,3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-5 \mathrm{endo}$ ) 1.71-1.87 (m, 2H, C-3) 2.17 (dddd, $J=13.8,11.4,5.1,3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-7 \mathrm{exo}$ ), 2.37 (q, $J=3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-1$ ), 2.43 (br s, 1 H , $\mathrm{OH}), 3.81-03.92(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}-6) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 15.88,24.52,27.85,36.30,43.36$, 51.63, 65.37 (aliphatic), $214.68(\mathrm{C}=\mathrm{O})$. IR (neat): 2982, 1796, 1757, 1169, 756, $707 \mathrm{~cm}^{-1}$.5-endo-Amido- 6-exo-phenyl[2.2.1]bicyclohept-2-one (80). Dimethyl amine was added subsurface for 30 min to a mixture of acid chloride $79(5.72 \mathrm{~g}, 23.1 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred overnight, followed by the
removal of the excess dimethyl amine under reduced pressure. $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ was added to the mixture, and the solution was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent removed under reduced pressure to give 6.5 g of crude product ( $100 \%$ yield). The product was recrystallized from ethyl acetate to obtain a light brown solid, mp 110-113 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): ~ \delta 1.89-2.01(\mathrm{~m}, 2 \mathrm{H}), 2.22-2.33(\mathrm{~m}, 2 \mathrm{H})$, $2.85(\mathrm{~s}, 1 \mathrm{H}), 2.97\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)\right), 2.99(\mathrm{~s}, 1 \mathrm{H}), 3.06\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)\right) 3.29(\mathrm{ddd}, J=5.7$, $4.2,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.86(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.17-7.31(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ar}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ $35.75,36.94,37.56,38.88,39.08,43.77,51.75,55.82$ (aliphatic), 126.28, 126.58, 128.53, 142.84, $171.13\left(\mathrm{C}=\mathrm{ON}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $214.41(\mathrm{C}=\mathrm{O})$.

## 5-endo-((N,N-Dimethylamino)methyl)-6-exo-phenyl[2.2.1]bicycloheptan-

 endo-2-ol borate salt (81). 1M borane in THF ( $98 \mathrm{~mL}, 101 \mathrm{mmol}$ ) was added to a mixture of amide $\mathbf{8 0}(6.5 \mathrm{~g}, 25.3 \mathrm{mmol})$ in THF ( 100 mL ). The reaction was heated to reflux for 2 d , followed by the addition of 6 M HCl until the mixture was acidic $(\mathrm{pH}<2)$. The mixture was then made basic by addition of NaOH pellets and the solvent was removed under reduced pressure. Brine ( 30 mL ) was added and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 75 \mathrm{~mL})$, the organic extracts combined, dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent removed under reduced pressure to obtain 6 g of crude product. The crude product was dissolved in ethyl acetate $(50 \mathrm{~mL})$ and the solution was passed through a plug of silica gel. The solvent was removed to give $\mathbf{8 1}$ as a white solid ( $4.90 \mathrm{~g}, 73 \%$ yield). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.2-1.32(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}-7), 1.45(\mathrm{dd}, J=11.7,1.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-3)$, 1.80-1.96(m, 2H, C-3, C-7), $2.04(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-1), 2.40\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.47(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.49(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-4), 2.64-2.78(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}-5), 2.97(\mathrm{dd}, J=13.5,5.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-8)$,3.08 (dd, $J=6.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-6), 3.15(\mathrm{dd}, J=13.2,6.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-8), 4.32$ (dt, $J=10.5$, $4.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-2), 7.16-7.31\left(\mathrm{~m}, 5 \mathrm{H}\right.$, ar). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 31.46,36.97,41.98,43.79$, 43.80, 51.24, 51.39, 52.36, 65.79, 72.27 (aliphatic), 126.11, 127.57, 128.56, 144.80.

## 5-endo-((N,N-Dimethylamino)methyl)-6-exo-phenyl[2.2.1]bicycloheptan-2-

 benzoylborate salts, ( 82 and 83 ). The transformation from alcohol 81 to benzoate 82 and $\mathbf{8 3}$ is illustrated. Alcohol $\mathbf{8 1}(333 \mathrm{mg}, 1.29 \mathrm{mmol})$ in benzene $(1 \mathrm{~mL})$ was added to a solution of benzoyl chloride ( $237 \mu \mathrm{~L}, 2.04 \mathrm{mmol}$ ), triethylamine ( $948 \mu \mathrm{~L}, 6.8 \mathrm{mmol}$ ), dimethylaminopyridine ( 2 mg ) in benzene $(2 \mathrm{~mL})$. The reaction mixture was heated to 50 ${ }^{\circ} \mathrm{C}$ for 2 d . The solvent was removed by reduced pressure, $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{~mL})$ was added and the mixture was washed with saturated $\mathrm{NaHCO}_{3}(3 \times 30 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent was removed under reduced pressure to obtain 566 mg ( $100 \%$ yield) of crude product. The product was purified by column chromatography using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as the eluant, followed by recrystallization from 7:2:1 hexane: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :ethyl acetate to give benzoate $\mathbf{8 3}(200 \mathrm{mg}, 36 \%$ yield) as a white solid.
## 5-endo-((N,N-Dimethylamino)methyl)-6-exo-phenylbicyclo[2.2.1]heptan-2-

 endo-benzoyl borate salt, (82). ( $125 \mathrm{mg}, 30 \%$ yield, white solid). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ 1.53-1.60 (m, 2H, C-3, C-7endo), 1.96 (dt, $J=10.8,1.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-7$ ), 2.17 (dddd, $J=14.4$, 10.2, 4.5, $1.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-7 \mathrm{exo}), 2.47\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.49\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.63$ (s, $1 \mathrm{H}), 2.65(\mathrm{~s}, 1 \mathrm{H}), 2.80(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}-5), 2.98(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-6), 3.02$ (dd, $J=13.8,4.5$ $\mathrm{Hz}, 1 \mathrm{H}, \mathrm{C}-8), 3.16$ (dd, $J=13.8,6.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-8), 5.27$ (dt, $J=10.8,4.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}-2$ ), 7.18-7.34 (m, 5H, Ar), $7.50\left(\mathrm{tt}, J=7.5,1.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ar}^{\prime}{ }_{3,5}\right), 7.61(\mathrm{tt}, \mathrm{J}=7.2,1.5 \mathrm{~Hz}, 1 \mathrm{H}$,$\left.\mathrm{Ar}^{\prime}{ }_{4}\right), 8.1\left(\mathrm{dd}, J=7.2,1.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ar}^{\prime}{ }_{2,6}\right) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 29.44,36.53,41.40$, 43.04, 45.27, 49.07, 51.37, 52.09, 65.72, 75.49 (aliphatic), 126.45, 127.47, 128.54, 129.42, 130.15, 133.14, 143.66, 166.28 (C=O). ## 5-endo-(( $N, N$-Dimethylamino)methyl)-6-exo-phenyl[2.2.1]bicycloheptan-2-

benzoate, (86 and 87). The free amine was obtained by stirring 180 mg of the borate salt in 4 mL of a $3: 1$ mixture of acetone and 1 M HCl for 10 min . The solvent was removed under reduced pressure and saturated $\mathrm{NaHCO}_{3}(30 \mathrm{~mL})$ was added. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{~mL})$, the organic extracts were combined, dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent was removed under reduced pressure to obtain 170 mg
of crude product. The product was purified by flash column chromatography using a 5:1 ethyl acetate:methanol eluant to give $\mathbf{8 6}(169 \mathrm{mg}, 98 \%$ yield) as a colorless oil.

## CHAPTER VII

## FUTURE WORK

## Introduction

To continue probing the constraints of binding at the DAT, additional analogs are proposed in this chapter for synthesis and pharmacological evaluation. The proposed compounds take into consideration the importance of the relative stereochemistry and the regiochemistry of the amine and phenyl group. Also, the optimal length between the nitrogen and the phenyl ring is explored by varying the number of carbons in a tether. This will allow for the construction of further SARs which, in turn, provides an insight into the binding at the DAT.

## Chemistry

## Synthesis of 2-amino-7-exo-norboranyl benzoate (76 and 78).

Since the other regioisomer of 71 (i.e. the exo-alcohol-exo-benzoate) was not obtained in pure from the mixture (Figure 5.3), an alternate pathway is suggested

Reagents: a) $15 \% \mathrm{KOH}$, THF; b) DMSO, oxalyl chloride, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; c) $\mathrm{NaBH}_{4}$, EtOH , reflux; d) $\mathrm{BH}_{3}, \mathrm{THF},-78^{\circ} \mathrm{C}$; and e) benzoyl chloride, DMAP, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

Figure 7.1. Proposed synthesis of amino[2.2.1]benzoates 76 and 78.
to synthesize benzoates 76 and 78 (Figure 7.1). Amino benzoate 76 can be made by the hydrolysis of benzoate 68 to the corresponding alcohol, the alcohol subjected to Swern oxidation conditions, reduced with $\mathrm{NaBH}_{4}$ to obtain a mixture of endo and exo alcohols, followed by benzoylation and separation. Amino benzoate 78 can be made by similar chemistry; hydrolysis of benzoate 69, Swern oxidation of the corresponding alcohol, a
borane reduction to obtain solely the exo-alcohol, followed by benzoylation to obtain the final product.

## Prospective Synthesis of 2-amino-3-phenyl-7-norboranyl benzoates (79).

The work described in this section takes advantage of the oxygen functionality on the C-7 carbon on the [2.2.1] skeleton, i.e. in Chapter 6 (Figure 6.2), and places an arene (phenyl, 4-chlorophenyl, benzyl, phenethyl, etc.) substituent at the C-5 position of the bicycle. Placing an oxygen functionality at the C-7 position of the [2.2.1]bicyclic scaffold and the introduction of an arene at the C-5 position allows for comparison to previously synthesized 6-( $N, N$-dimethylamino)-5-phenyl bicyclo[2.2.2]octanes. ${ }^{1}$ The substitution at the C-7 position in compound $\mathbf{B}$ (Figure 7.1) provides compounds which fill the space

A

B

C

between carbons 2 and 3 on the triisubstituted [2.2.2]octanes $\mathbf{A}$ and $\mathbf{C}$ (Figure 7.2). This chemistry can be achieved by selectively protecting diol $\mathbf{6 0}$ on the two-carbon bridge using TMSCl (Figure 7.3). The alcohol on the C-7 carbon can then be protected using benzyl chloride, followed by the hydrolysis of the TMS protecting group at the C-2 position. The alcohol is then exposed to Swern oxidation conditions, followed by addition of a phenyl or 4-chlorophenyl Grignard reagent to the ketone. Dehydration of the Grignard adduct, hydroboration of the resulting alkene, and exposing the alcohol to Swern oxidation conditions will provide a ketone at the C-6 position on the bicycle. Reductive amination of the ketone and concomitant deprotection of the benzyl group gives diastereomeric amino alcohols, which will be separated by column chromatography. The amino alcohol will then be exposed to Swern oxidation conditions, reduced with sodium borohydride, and followed by benzoylation to obtain the corresponding amino benzoates 79 .

Reagents: a) $\mathrm{HClO}_{4}, \mathrm{H}_{2} \mathrm{O}$; b) LDA, TMSCl, $-78{ }^{\circ} \mathrm{C}$; c) NaH , benzyl chloride, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; d)

1) $\mathrm{HCl}, \mathrm{THF}$; 2) Swern oxidation conditions; e) phenyl or 4-chlorophenyl magnesium bromide, ether, $-20^{\circ} \mathrm{C}$, f) p-TSA, toluene, heat; g) $\mathrm{BH}_{3}, \mathrm{H}_{2} \mathrm{O}_{2}$, THF; h) Swern oxidations conditions, i) 1) $\mathrm{NH}\left(\mathrm{CH}_{3}\right)_{2} \cdot \mathrm{HCl}, \mathrm{Et}_{3} \mathrm{~N}$; and 2) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; j) 1) Swern oxidation conditions; 2) $\mathrm{NaBH}_{4}, \mathrm{EtOH} ; 3$ ) benzoyl chloride, DMAP, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

## APPENDIX A

## Structural Assignment of 19.

Signal a at $\delta 2.60 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR (Figure A.1) appears as a quartet with a coupling constant of 3 Hz , which can be assigned to the bridgehead carbon on $\mathrm{C}-1$. This bridgehead carbon is coupled to one proton on C-6 and two protons on C-7, apparently with similar coupling constants. Signal b at $\delta 2.40 \mathrm{ppm}$, was assigned to the exo proton on C-6 since this is the only proton that couples to protons in cis $(9.3 \mathrm{~Hz}, \mathrm{C}-5)$ and trans (4.5 Hz, C-5) methinine positions on the bicycle, and is coupled to a bridgehead proton ( $3.0 \mathrm{~Hz}, \mathrm{C}-1$ ). Signal $\mathbf{d}$ at $\delta$ 2.21-2.23 ppm was assigned to the bridgehead proton at C-4
and the dimethylamine protons $(7 \mathrm{H})$. The signals $\mathbf{c}(\delta 2.30 \mathrm{ppm})$ and $\mathbf{e}(\delta 2.18 \mathrm{ppm})$ were assigned to the endo and exo protons on C-3, respectively. These two signals both contain geminal coupling ( 18 Hz ), coupling to the bridgehead proton at $\mathrm{C}-4(2.1 \mathrm{~Hz})$, and a long range in-plane "W-coupling" to the exo protons on C-5 and C-8 (2.1 Hz) as illustrated in the above structure with the highlighted bonds. The peak at $\delta 1.93$ (quartet of triplets), signal f, was assigned to the exo proton on C-5. The exo proton on C-5 is the only proton on the bicycle, which has geminal coupling ( $13.2 \mathrm{~Hz}, \mathrm{C}-5$ endo), cis coupling ( $9.3 \mathrm{~Hz}, \mathrm{C}-$ 6 exo $)$, coupled to the bridgehead proton at C-4 ( $3.0 \mathrm{Hz)}$, and a long range in-plane "Wcoupling" with the exo proton on C-2. It is this long range "W-coupling" between the exo proton on C-2 and the exo proton on C-5 and the cis coupling between the exo proton on C-5 and the exo proton on C-6 which establishes the stereochemistry at the C-6 stereocenter.

Figure A.1. ${ }^{1} \mathrm{H}$ NMR spectrum (Gemini $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of amino ketone 19.

## APPENDIX B

## Structural Assignment of 24

The stereochemistry at the C-6 stereocenter is the opposite of that assigned to amino ketone 19 (Appendix A). Signal a ( $\delta 3.89 \mathrm{ppm}$ ) was assigned to the endo proton of the hydroxy substituted methine, C-2. The multiplicity of this peak, $d d d d$, arises from a cis coupling with the endo proton on C-3 $(9.6 \mathrm{~Hz})$, a trans coupling with the exo proton on C-3 ( 6.6 Hz ), coupling to the bridgehead proton on C-1 (3.3 Hz), and a long range inplane "W-coupling" with the exo proton on C-7 $(0.9 \mathrm{~Hz})$ as illustrated by the highlighted bonds in the structure above. Since this is the only arrangement on the bicycle, which
would allow "W-coupling" of the proton on C-2, this piece of evidence establishes the stereochemistry at the C-2 stereocenter. The relative stereochemical assignment was confirmed by x-ray analysis (Figure B.2).

## APPENDIX C

## Structural Assignment of 27.

Figure C.1. The ORTEP Diagram of Benzoate 27.

Table C.1. Crystal data and structure refinement for benzoate 27.

| Identification code | coons4 |
| :---: | :---: |
| Empirical formula | C17 H24 Cl N O2 |
| Formula weight | 309.82 |
| Temperature | 198(2) K |
| Wavelength | 0.71073 A |
| Crystal system, space group | Monoclinic, P2(1)/c |
| Unit cell dimensions | $\begin{aligned} & \mathrm{a}=6.3245(9) \mathrm{A} \text { alpha }=90 \text { deg. } \\ & \mathrm{b}=10.8229(15) \mathrm{A} \quad \text { beta }=96.448(2) \mathrm{deg} . \\ & \mathrm{c}=24.494(3) \mathrm{A} \text { gamma }=90 \text { deg. } \end{aligned}$ |
| Volume | 1666.0(4) A^3 |
| Z, Calculated density | 4, $1.235 \mathrm{Mg} / \mathrm{m}^{\wedge} 3$ |
| Absorption coefficient | $0.234 \mathrm{~mm}^{\wedge}-1$ |
| $F(000)$ | 664 |
| Crystal size | $0.24 \times 0.22 \times 0.04 \mathrm{~mm}$ |
| Theta range for data collection | 1.67 to 25.00 deg. |
| Limiting indices | $-7<=\mathrm{h}<=4,-11<=\mathrm{k}<=12,-29<=1<=27$ |
| Reflections collected / unique | $8320 / 2925[\mathrm{R}($ int $)=0.0664]$ |
| Completeness to theta $=25.00$ | 99.8 \% |
| Absorption correction | None |
| Max. and min. transmission | 0.9907 and 0.9465 |
| Refinement method | Full-matrix least-squares on $\mathrm{F}^{\wedge} 2$ |
| Data / restraints / parameters | 2925 / 0 / 208 |
| Goodness-of-fit on $\mathrm{F}^{\wedge} 2$ | 1.061 |

Final R indices [ $\mathrm{I}>2 \operatorname{sigma}(\mathrm{I})$ ]
$R 1=0.0754, w R 2=0.1543$
R indices (all data)
$R 1=0.1277, w R 2=0.1875$
Largest diff. peak and hole
0.466 and -0.478 e. $\mathrm{A}^{\wedge}-3$

Table C.2. Atomic coordinates ( $\times 10^{\wedge} 4$ ) and equivalent isotropic displacement parameters $\left(\mathrm{A}^{\wedge} 2 \times 10^{\wedge} 3\right)$ for benzoate $27 . \mathrm{U}(\mathrm{eq})$ is defined as one third of the trace of the orthogonalized Uij tensor.

## APPENDIX D

## Structural Assignment of 29.

The stereochemistry at the C-6 stereocenter was previously assigned for amino ketone 19 (Appendix A). Signal a at $\delta 2.31-2.41 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR spectrum appears as a multiplet and is assigned to the six protons of dimethyl amine and the exo proton on C-3 (Figure D.1). The 2-D NOESY spectrum shows cross-coupling between the meta protons on the phenyl ring and signal a, since the exo proton on C-3 is cis to the phenyl ring (Figure D.2). The HMQC spectrum indicates that one of the protons assigned to signal a (the exo proton on C-3) and the proton assigned to signal $\mathbf{e}$ apparently are on the
same carbon, C-3 (Figure D.3). Signal e appears as a $d t$ at $\delta 2.00$ with couplings of 14 Hz (geminal coupling with the exo proton on C-3), and 2.1 Hz with the bridgehead proton at C-4 and the exo proton at C-8. The NOESY spectrum also shows a cross-coupling peak between signal $\mathbf{e}$ and signal $\mathbf{g}$, assigned as the endo proton on C-5. Signal $\mathbf{g}$ appears as a $q t$ at $\delta 1.81 \mathrm{ppm}$ due to geminal coupling (13.2 Hz with the exo proton on C-5), trans coupling (7.5 Hz with the exo proton on C-6), coupling to the C-4 bridgehead proton (1.8 $\mathrm{Hz})$, and an in-plane "W-coupling" with the endo proton on C-8 (2.4 Hz). This peak was assigned to the endo proton on C-5 because this is the only proton on the bicycle with these neighboring protons.

## APPENDIX E

## Structural Assignment of 31.

$$
\begin{aligned}
& \mathrm{n}=\text { endo } \\
& \mathrm{x}=\text { exo }
\end{aligned}
$$

The stereochemistry at the C-6 stereocenter was previously assigned for amino ketone 19 (Appendix A). The signal at $\delta 3.31 \mathrm{ppm}$ (signal a) in the ${ }^{1} \mathrm{H}$ NMR spectrum (Figure E.1) of $\mathbf{3 1}$ was assigned to the endo proton on C-6 based on cross-coupling seen in the HMBC spectrum between the ipso carbon of the exo phenyl ring and the benzylic proton on C-6 (Figure E.2). The ${ }^{1} \mathrm{H}$ NMR spectrum shows a qt for signal a, which is consistent with cis coupling (with the endo proton on C-3, 10.5 Hz), trans coupling (with the exo proton on C-3, 8 Hz ), coupling with the bridgehead proton on C-1 $(1.5 \mathrm{~Hz})$, and
an in-plane W-coupling with the exo proton on C-7 (1.5 Hz). A cross-coupling exists in the NOESY spectrum between the endo proton on C-6, signal a, and the endo dimethyl amine six proton singlet, signal $\mathbf{b}$ (Figure E.3.). This is the only arrangement on the bicycle, which will give rise to a NOESY between the endo proton on C-6 and the endo dimethyl amine moiety. The assignment was verified by singly crystal X-ray crystallography.

## APPENDIX F

## Structural Assignment of 39.

The stereochemistry at the C-6 stereocenter was previously assigned for the amino ketone 19 (Appendix A). The HMQC spectrum of benzyl amine 39, indicates the peaks at $\delta 2.67 \mathrm{ppm}(d d, 13.2$ and 6.6 Hz , signal a) and $\delta 2.49 \mathrm{ppm}(d d, 13.2$ and 9.3 Hz , signal b) in the ${ }^{1} \mathrm{H}$ NMR spectrum are on the same carbon (Figure F.1). Signals $\mathbf{a}$ and $\mathbf{b}$ were assigned to the two benzylic protons at C-9. The COSY spectrum shows cross-
coupling between signals a and band signal ce (Figure F.2). The peak at $\delta 2.20 \mathrm{ppm}(1 \mathrm{H}$, signal $\mathbf{c}$ ) was assigned to the proton at C-6. The COSY spectrum also shows crosscoupling between signal $\mathbf{c}$ and the peaks labeled $\mathbf{f}$ and $\mathbf{I}$. Signal $\mathbf{I}$, a quartet of triplets, was assigned to the exo proton on C-5 based on the ${ }^{1} \mathrm{H}$ NMR spectrum (Figure F.3) coupling constants ( $\mathrm{J}=12_{\text {geminal }}, 7_{\text {trans }}, 2_{\text {bridgehead and } \mathrm{W}} \mathrm{Hz}$ ). Also, the NOESY spectrum shows a cross-coupling between signals a and $\mathbf{I}$, which indicates the close proximity of the protons on C-5 to the benzyl proton on C-9 (Figure F.4). The HMQC spectrum indicates the multiplet labeled $\mathbf{f}$ at $\delta$ 1.81-1.73 ppm has two protons on the same carbon. Signal $\mathbf{f}$ was assigned to the protons at C-7. The COSY spectrum indicates a long-range coupling between the endo proton at C-6, signal $\mathbf{f}$ and signal $\mathbf{e}$, the exo proton on C-2. This piece of evidence provides the correct relative stereochemistry at C-6.

Further analysis of compounds that contain protons on the same face of the bicycle and whose chemical shifts are affected by the dimethylamine moiety can be found in Appendix P. This provides additional evidence with the relative stereochemical assignment.

Figure F.1. The HMQC spectrum (Bruker AMX $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of benzyl arene $\mathbf{3 9}$.

Figure F.1. The ${ }^{1} \mathrm{H}$ NMR spectrum (Mercury Varian $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of benzyl 39.

Figure F.3. The COSY spectrum (Bruker AMX $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of benzyl arene 39 .

Figure F.4. The NOESY spectrum (Bruker AMX $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of benzyl arene 39 .

## APPENDIX G

## Structural Assignment of 42.

The relative stereochemical assignment of the endo-phenethyl arene $\mathbf{4 2}$ was determined by single crystal x-ray crystallography.

Figure G.1. The Ellipsoid Drawing of endo-phenethyl arene 42.

Symmetry transformations used to generate equivalent atoms:

## APPENDIX H

## Structural Assignment of 52.

The assignment of endo amino endo alcohol 52 was elucidated by single crystal
X-ray diffraction.

Figure H.1. The ORTEP drawing of endo-amino-endo-alcohol 52.

## APPENDIX I

## Structural Assignment of 57.

The assignment of exo-amino-exo_benzoate 57 was elucidated by single crystal Xray diffraction.

Figure I.1. The ORTEP drawing of exo-amino- exo-benzoate 57.

Table I.1. Crystal data and structure refinement for exo-amino-exo-benzoate 57.

| Identification code | sc04_109 |
| :---: | :---: |
| Empirical formula | C17 H23 N O2 |
| Formula weight | 273.36 |
| Temperature | 173(2) K |
| Wavelength | 1.54178 Å |
| Crystal system | Monoclinic |
| Space group | P2(1)/n |
| Unit cell dimensions | $\mathrm{a}=9.0507(8) \AA \quad \alpha=90^{\circ}$. |
|  | $b=11.2442(9) \AA \quad \beta=97.826(5)^{\circ}$. |

## APPENDIX J

## Structural Assignment of 60.

Signal a at $\delta 3.84 \mathrm{ppm}$ (singlet) in the ${ }^{1} \mathrm{H}$ NMR spectrum (Figure J.1) was assigned to the proton on C-7. Signal $\mathbf{b}$ at $\delta 3.70$ appears as a broad doublet and can be assigned to the endo proton on C-2 due to the 6.6 Hz coupling with the endo proton on C3. The exo position of the hydroxyl group on C-2 can be discerned from the lack of coupling between the endo proton on C-2 and the proton on C-1. Also, a signal in the

COSY spectrum (Figure J.2) for coupling between signal a and signal buggests the proton on C-7 is exo and the proton on C-2 is endo. This is the only arrangement, which would give rise to a COSY between these two protons. A COSY exists between signal b and the peak assigned as signal $\mathbf{c}$ at $\delta 1.99 \mathrm{ppm}$. Signal $\mathbf{c}$ was assigned to the proton on C-4. Signal d at $\delta 1.90 \mathrm{ppm}$ appears as a doublet and can be assigned to the bridgehead proton on C-1. The peak at $\delta 1.75 \mathrm{ppm}$, which appears as a doublet of doublets (13.8 and 7.5 Hz ), was assigned to the endo proton on C-3 (signal e). Signal $\mathbf{f}$ at $\delta 1.60 \mathrm{ppm}$ (doublet) was assigned to the exo proton on C-3. The multiplet at $\delta 1.46-1.23 \mathrm{ppm}$ was assigned to the endo protons on C-6 and C-5, signal g. The HMQC spectrum (Figure J.3) shows the two protons are on different carbons. A COSY between signal $\mathbf{g}$ and signal $\mathbf{d}$, and signal $\mathbf{g}$ and signal $\mathbf{c}$ suggests the two protons in signal $\mathbf{g}$ are the endo protons on C-6 and C-5. The multiplet at $\delta 0.91-0.79 \mathrm{ppm}$ was assigned to the exo protons on C-6 and C5, signal h.

Figure J.1. The ${ }^{1} \mathrm{H}$ NMR spectrum of syn diol $\mathbf{6 0}$.

Figure J.2. The HMQC NMR spectrum of syn diol $\mathbf{6 0}$.

Figure J.3. The COSY NMR spectrum of syn diol $\mathbf{6 0}$.

## APPENDIX K

## Structural Assignment of 64.

Signals a, b, $\mathbf{c}$ between $\delta 7.24-7.82 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR spectrum (Figure K.1) were assigned to the aromatic protons of the benzoate. Signal d at $\delta 5.17$ appears as a ddd and can be assigned to the endo proton on C-2 due to the cis coupling ( 8 Hz ) with the endo proton on C-3, trans coupling ( 2.1 Hz ) with the exo proton on C-3, and coupling to the bridgehead proton on C-1 $(0.9 \mathrm{~Hz})$. This peak alone provides the correct regioisomer and stereochemistry at the C-2 stereocenter and is consistent with the structure shown above.

Figure K.1. The ${ }^{1} \mathrm{H}$ NMR spectrum of keto benzoate 64.

## APPENDIX L

## Structural Assignment of 66.

L1. The Elllipsoid Diagram of amino benzoate 66.

Table 1. Crystal data and structure refinement for benzoate 66.

| Identification code | sc0533s |
| :---: | :---: |
| Empirical formula | C16 H22 Cl N O2 |
| Formula weight | 295.80 |

## APPENDIX M

## Structural Assignment of 68.

The stereochemistry at the C-7 stereocenter was established in the formation of 2,7-syn diol 58 (Appendix J). The stereochemistry does not change upon benzoylation. Signals a, b, $\mathbf{c}$ between $\delta$ 7.45-8.04 ppm in the ${ }^{1} \mathrm{H}$ NMR spectrum (Figure M.1) were assigned to the aromatic protons of the benzoate. Signal d at $\delta 5.09 \mathrm{ppm}$ appears as a broad doublet and can be assigned to the exo proton on C-7. Signal e at $\delta 2.65 \mathrm{ppm}$ appears as a doublet of
triplets and can be assigned to the exo proton on C-2 due to the cis coupling ( 8 Hz ) with
 to the bridgehead proton on $\mathrm{C}-1(4.5 \mathrm{~Hz})$. This peak alone suggests the proton at the $\mathrm{C}-2$ stereocenter is exo and is consistent with the structure shown above. The structure was confirmed by x-ray diffraction (Figure M.2).

Figure M.1. The ${ }^{1} \mathrm{H}$ NMR spectrum of keto benzoate 68.

Figure M.2. The Ellipsoid structure of amino-benzoate 68.

## APPENDIX N

## Structural Assignment of 78.

The connectivity of the atoms is established based on the mechanism of the reaction of the double-Michael addition of tert-butyl acrylate and cyclopentenone. Deprotection of the $t$-butyl ester does not change the connectivity or the stereochemistry. Signal a at $\delta 8.80 \mathrm{ppm}(\mathrm{br} \mathrm{s})$ in the ${ }^{1} \mathrm{H}$ NMR spectrum of 78 (Figure N.1) was assigned to the OH of the carboxylic acid. Signal $\mathbf{b}$ at $\delta 7.20-7.37$ appears as a multilplet and can be
assigned to the aromatic protons on the phenyl ring at C-6. Signal $\mathbf{c}$ at $\delta 3.53 \mathrm{ppm}$ was assigned to the endo proton on C-6. The multiplicity of signal $\mathbf{c}$ is consistent with a proton with trans coupling ( $d, 4.5 \mathrm{~Hz}$ ) to the proton at C-5. Since no coupling is seen between signal $\mathbf{c}$ and the bridgehead proton on $\mathrm{C}-1$, this indicates the proton must be in the endo position. To further corroborate this stereochemical assignment, signal $\mathbf{d}$ at $\delta$ 3.25 ppm was assigned to the proton at $\mathrm{C}-5$. The multiplicity of this peak, a triplet (4.8 Hz ) is consistent with a exo proton at C-5 that trans couples to the endo proton on C-6 and couples with the bridgehead proton on C-4 with a similar coupling constant. This establishes the stereochemistry at the C-5 and C-6 stereocenters of the bicycle. The peak at $\delta 3.16(\mathrm{br} \mathrm{s})$ was assigned to the bridgehead proton on C-4, signal e. The peak at $\delta 2.90$ ppm (singlet) was assigned to the proton on C-1, signal $\mathbf{f}$. Signal $\mathbf{g}$, was assigned to the endo and exo proton on C-3 and one of the protons on C-7. The peak at $\delta 1.92 \mathrm{ppm}(\mathrm{d})$ was assigned to one of the protons on C-7, signal $\mathbf{h}$. The coupling of 10.5 Hz is consistent with geminal coupling at C-7.

Figure N.1. ${ }^{1} \mathrm{H}$ NMR spectrum(Gemini $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of carboxylic acid 78.

## APPENDIX 0

## Structural Assignment of 82.

The signals at $\delta 8.10 \mathrm{ppm}(2 \mathrm{H}$, signal a), $\delta 7.61 \mathrm{ppm}(1 \mathrm{H}$, signal b),$\delta 7.50 \mathrm{ppm}$ $(2 \mathrm{H}$, signal $\mathbf{c})$ and $\delta 7.34-7.18 \mathrm{ppm}(5 \mathrm{H}$, signal d) account for all of the protons of the two phenyl rings in the ${ }^{1} \mathrm{H}$ NMR spectrum of benzoate 82 (Figure O.1). The absorption at $\delta 5.27 \mathrm{ppm}(1 \mathrm{H}$, signal $\mathbf{e})$ was assigned to the proton at $\mathrm{C}-2$. The absorptions at $\delta 3.16$
$\operatorname{ppm}(1 \mathrm{H}, 13.8 \mathrm{~Hz}, 6.9 \mathrm{~Hz}$, signal f) and $\delta 3.02 \mathrm{ppm}(1 \mathrm{H}, 13.8 \mathrm{~Hz}, 4.5 \mathrm{~Hz}$, signal g) were assigned to the protons at C-8. The doublet at $\delta 2.98(1 \mathrm{H}, 6.9 \mathrm{~Hz}$, signal $\mathbf{h})$ was assigned to the proton at C-6. This shows trans stereochemistry between the protons on C-6 and C5. There doesn't appear to be coupling to the bridgehead proton at $\mathrm{C}-1$ and the proton at C-6, signal f, so this suggests the proton at C-6 is endo. The multiplet at $\delta 2.84-2.77$ $\operatorname{ppm}(1 \mathrm{H}$, signal $\mathbf{i})$ was assigned to the proton of C-3. The absorptions at $\delta 2.65 \mathrm{ppm}(1 \mathrm{H}$, singlet, signal $\mathbf{j}$ ) and $\delta 2.63 \mathrm{ppm}(1 \mathrm{H}$, singlet, signal $\mathbf{k})$ were assigned to the bridgehead protons of C-1 and C-4. The singlets at $\delta 2.49 \mathrm{ppm}(3 \mathrm{H}$, singlet, signal l) and 2.47 ppm $(3 H$, singlet, signal $\mathbf{m})$ were assigned to the two methyl groups on the amine. The signal at $\delta 2.17 \mathrm{ppm}(1 \mathrm{H}, 14.4 \mathrm{~Hz}, 10.2 \mathrm{~Hz}, 4.5 \mathrm{~Hz}, 1.8 \mathrm{~Hz}$, signal $\mathbf{n})$ was assigned to the exo proton on $\mathrm{C}-5$. The COSY NMR spectrum (Figure O.2) shows that the proton on C-5 is coupled to signal $\mathbf{i}$, corresponding to the proton on $\mathrm{C}-3$. The only possible stereochemical assignment which allows coupling between the protons on C-5 and C-3 is when both protons are exo. The signal at $\delta 1.96 \mathrm{ppm}(1 \mathrm{H}$, signal $\mathbf{0})$ corresponds to one of the protons on C-7. The absorption at $\delta 1.60-1.53 \mathrm{ppm}$ (signal $\mathbf{p}$ ) corresponds to the endo proton on C-5 and C-7.

The structure of compound $\mathbf{8 2}$ was also confirmed by x-ray analysis (Figure O.3).

Figure O.1. The ${ }^{1} \mathrm{H}$ NMR (Gemini $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) and ${ }^{13} \mathrm{C}$ (Bruker AMX 500 MHz , $\mathrm{CDCl}_{3}$ ) spectra for benzoate $\mathbf{8 2}$.

## APPENDIX P

Relative Stereochemical Assignment of Compounds 31, 32, 39, 41, 10, 22, 21, 50, 51, 54, 55, 69, 70.

## Introduction

In most cases throughout this thesis, stereochemistry assignments of diastereomers has been assigned based on 1- and 2-D spectroscopy techniques and either validated or determined by x-ray diffraction. exo-Amino-endo- benzoate 69 and endo-amino-exo-benzoate $\mathbf{7 0}$ is the only case in this thesis where the assignment of the relative stereochemistry could not be done with a certain level of confidence and further evaluation was needed to provide additional evidence. A common feature that may not

Figure P.1. Comparison of amines 69 and 70.
seem immediately apparent found in some sets of diastereomers is the proximity of a proton to the dimethylamine group, whose 1H NMR chemical shift could be affected by the electronegative nitrogen atom. These protons can be assigned in the ${ }^{1} \mathrm{H}$ NMR of certain compounds and allow for a direct comparison with the corresponding diastereomer (Figure P.1). The protons syn to the nitrogen, either directly above (i.e. amine 41) or below (i.e. amines 70) should be shifted further downfield than their corresponding diastereomers in the free amine. In the case of final products where the amine is converted to an HCl salt, the difference in chemical shifts between the two free amines and two salts should increase due to the protonation of the nitrogen.

## Results

A table was constructed with all the compounds synthesized in this thesis that contain the same relationship as noted above: a proton on the same face of the bicycle as the nitrogen which can be assigned in the ${ }^{1} \mathrm{H}$ NMR (Table P.1). Only final products were converted to HCl salts and some HCl salts were evaluated in different solvents. As a result, not all the compounds allow for comparison of the difference in chemical shifts between the free amine and salt. In all cases illustrated in the table with respect to the free amine, the diastereomer with the syn proton either directly above or below the dimethylamine is further downfield than its corresponding diastereomer. For example, the benzylic proton on amine $\mathbf{3 1}$ is shifted further at $\delta 3.31 \mathrm{ppm}$ than amine $\mathbf{3 2}$ at $\delta 2.98 \mathrm{ppm}$. The structure assignment of amine $\mathbf{3 1}$ was verified by x -ray analysis (Appendix E). The proton $\alpha$ to the benzoate in amine 26a is also further downfield ( $\delta 5.41 \mathrm{ppm}$ ) than amine 10 ( $\delta 5.15 \mathrm{ppm}$ ). These results were confirmed by x-ray diffraction of amine $\mathbf{1 0} .{ }^{1}$ This
trend is consistent throughout the table, even when the proton is four carbons away, as is the case with alcohols $\mathbf{5 0}$ and $\mathbf{5 1}$ ( $\delta 3.90 \mathrm{ppm}$ vs $\delta 3.73 \mathrm{ppm}$, respectively; Appendix H) and benzoates 54 and $\mathbf{5 5}$ ( $\delta 5.15 \mathrm{ppm}$ and $\delta 5.03 \mathrm{ppm}$ ).

The difference in chemical shifts between the two diastereomers when comparing the free amine and the HCl salt does not show a clear trend with respect to the relative stereochemistry. For example, the difference in the chemical shift of the proton $\alpha$ to the benzoate in the free amines $\mathbf{2 6 a}$ and $\mathbf{1 0}$ is 0.26 while in the HCl salt the difference is 0.09. For benzoates $\mathbf{5 4}$ and $\mathbf{5 5}$ there wasn't a difference between seen between the free amine and the salts, the difference in both cases is 0.05 . In the case of amines 69 and 70, the difference between the free amines is 0.34 and 0.53 for the salts, the opposite of that seen between 26a and 10.

Table P. 1 indicates the proton $\alpha$ to the benzoate in amine 70 is further downfield at $\delta 5.50 \mathrm{ppm}$ than the same proton on amine $\mathbf{6 9}$ at $\delta 5.16 \mathrm{ppm}$. Using the same argument that the nitrogen affects the chemical shifts of protons in close proximity, the amine of compound 70 is endo, while the amine of compound $\mathbf{6 9}$ must be exo.

Table P.1. Comparison of endo vs exo Substituents Directly Above or Below a Nitrogen in a variety of [2.2.1] and [2.2.2]bicycles.

| Compound | Chemical shift (ppm) of free amine (A) | Chemical shift $(\mathrm{ppm})$ of HCl salt (B) | Same face opposite face |
